Accordingly, we reverse the judge's ruling that evidence of the alleged section 5(a)(1) violation should be excluded, and we remand this case to the judge to address the merits of this alleged violation.

SO ORDERED.

8/ Chairman Rowland does not join in the discussion of the open fields issue. Not only is the discussion of that issue unnecessary for the disposition of the case, see note 7, supra, but in Chairman Rowland's view, the record does not clearly support the majority's conclusions that, absent the consent from Mrs. Byrd, Medlock's observations were made from an unrestricted area or that Ackermann could have no reasonable expectation of privacy with respect to the area observed.

APPEARANCES:

F. Benjamin Riek, III, Esquire, U. S. Department of Labor, Cleveland, Ohio, on behalf of complainant.

William F. Ultsch, Esquire, Cincinnati, Ohio, on behalf of respondent.

## DECISION AND ORDER

SPARKS, Judge: While waiting in respondent's parking lot for the arrival of a company official with authority to permit an inspection, an OSHA Compliance Officer observed three employees riding in the bucket of a backhoe. Respondent refused to allow an inspection without an inspection warrant and contends that any observations made prior to obtaining the warrant cannot be used as the basis of an alleged violation.

About a month later, after the warrant was obtained, the authorized inspection was conducted on July 7, 1980. During the walk around, an extension cord without a grounding prong was found in one of the work areas.

Two citations were contested: one charged a serious violation of Section 5(a)(1) of the Occupational Safety and Health Act, ("Act"), the general duty clause; and a second alleged a repeated violation of 29 C.F.R. § 1926.401(c).

I

Observations Made Prior to Obtaining a Search Warrant

Respondent contends that observations by the Compliance Officer prior to obtaining an inspection warrant cannot be used as evidence to prove an alleged violation.

On June 10, 1980, Compliance Officer Robin R. Medlock was returning to Cincinnati, Ohio, on Highway 32 in Clermont County after completing an accident investigation (Tr. 11). As he drove along, he saw respondent's construction activity and two conditions which he thought to be in violation of OSHA standards (Tr. 15, 53). After conferring with his supervisor, he was instructed to conduct an inspection of the worksite under OSHA's "general schedule" procedures.

Mr. Medlock arrived at respondent's office near the worksite at approximately 12:30 p.m. to 12:45 p.m., on June 11, 1980. He was informed by the office secretary that only Mr. Tom Ackermann, president and owner, or Mr. Jerry Westerkamp, superintendent, could authorize him to conduct an inspection. The secretary stated that neither man was at the project at that time, but Mr. Westerkamp might be back a little later (Tr. 20). The Compliance Officer then indicated that he would wait around for a while to see if the men returned, to which she consented (Tr. 20).

Mr. Medlock went out into the parking lot right outside the office and waited in and near his car. After waiting 15 to 30 minutes, he observed people riding in the

bucket of a front-end loader backhoe at a distance of about 300 to 350 feet (Tr. 21-22). He watched as they made eight to ten trips in the backhoe and made photographs of them with a camera equipped with a zoom lens (Tr. 23, 93, 107).

Counsel for respondent objected to the admissibility of any evidence concerning the conditions which the Compliance Officer observed on the grounds that evidence secured before a warrant was issued constituted an illegal search (Tr. 21, Respondent's Brief, page 5).

In the watershed decision, the Supreme Court held in Marshall v. Barlow's, Inc., 436 U.S. 307, 98 S. Ct. 1816 (1978), that the protection of the Fourth Amendment extends to businesses and that the OSHA inspector, without a warrant, "... stands in no better position than a member of the public", (436 U.S. 315, 98 S.Ct. 1822). The Court noted, however, that there were no restrictions on reports by employees of conditions which they observe in the non-public areas of an employer's business.

Other cases have held that a compliance officer may properly observe conditions from public areas such as highways. Laclede Gas Company, 79 OSAHRC 94/E13, 5 BNA OSHC 2013, 1979 OSHD ¶ 24,007 (Docket No. 76-3241, 1979).

In the instant case, the Compliance Officer was specifically denied permission to conduct the inspection until approval had been obtained from a designated official. He was authorized to remain on the premises but only for the limited purpose of waiting for an appropriate person to arrive.

While waiting, he saw a backhoe with people in the bucket. Although it was about 300 to 350 feet away, by using the zoom lens of a camera he could tell there were three people in the bucket. Two were young men about 18 years old with wavy hair (Tr. 93, 107).

As a parking lot is a public area to some extent, observations made from it could be considered, arguably, as comparable to observations from a public highway. The parking lot here, however, is a private lot, not like the parking lot of a shopping center. The compliance officer sought and obtained permission to wait, but there is no indication that there was consent to permit more than just wait.

In Laclede gas, supra, which involved an inspection prior to the Barlow's, Inc., decision, the Review Commission held that photographs and observations by a Compliance Officer were admissible when made from a public highway with a telephoto lens at a distance of 200 to 300 feet, even though the photographs were made prior to presenting his credentials to company officials. The decision suggests there is implied consent to observe activities within "plain view."

In the instant case the observations were made from respondent's private property, not a public highway, and were made after the Compliance Officer had been specifically refused permission to conduct the inspection. There is no indication that the conditions were within plain view of the general public. The Compliance Officer's only purpose for being on respondent's property was to conduct an inspection. His observations were not random views seen while going about other business.

The Barlow's, Inc. decision holds that inspections conducted without a warrant or the consent of the employees is an unconstitutional infringement of the Fourth Amendment. The facts of the instant case do not establish actual or implied consent to observe the activities at the worksite.

At the hearing there was no testimony from anyone who had ridden in the bucket of the backhoe or anyone who had observed such activity. There was

testimony by the Compliance Officer that while on his walk around inspection on July 7, 1980, after obtaining a warrant, an employee admitted riding in the bucket. The Compliance Officer testified as follows:

> "I said, ""Do you work for Ackermann Enterprises?"
> And he said, "Yes."
> And I said, "Do you remember me taking photographs at the other end of the building?"
> And he said, "Yes, I remember you taking photographs of us in the front-end bucket."
> And I asked him who the other employees were that work for Ackermann in that bucket at that time, and he said he did not remember who they were. However, that he was an employee that was in the front bucket of that front-end loader." (Tr. 44).

The testimony, although hearsay, was admitted under Rule 801(D)(2) of the Federal Rules of Evidence and would be admissible under the decisions of the Review Commission regarding hearsay testimony. It is clear, however, that all evidence concerning the incident of employees riding in the bucket of the backhoe arise directly from the observations of the Compliance Officer and is likewise found to infringe upon respondent's Fourth Amendment rights. As there is no untainted evidence to support citation number one, it will be dismissed.

II

The Alleged Repeated
Violation of 29 C.F.R. § 1926.401(c)

After obtaining an admittedly valid warrant (Tr. 27), the inspection was conducted on July 7, 1980. During the walk around, the Compliance Officer saw two extension cords which lacked proper grounding. There is considerable confusion in the record whether the two cords were plugged together or one was substituted for the other, but both were at the work site (Tr. 36-37, 99-100, 109-110, 121-123, 148).

Citation number two alleged a repeated violation of 29 C.F.R. § 1926.401(c) in that the grounding path was not permanent and continuous as an extension cord supplying power to a Milwaukee right angle drill had the grounding pin missing.

To the extent there is conflict in the testimony of witnesses, I credit the testimony of the Compliance Officer that he observed an extension cord connected to a power source which was in use or available for use and which lacked a grounding prong (Tr. 37). There is some question whether the extension cord was connected to a right angle drill or a double insulated Sawsall. Witnesses for respondent argue that the extension cord was connected to the Sawsall which was a double-insulated tool and did not require a ground (Tr. 123, 139). Because of the work being done, running duct, the witnesses testified the Sawsall, not the right angle drill, had been used that day (Tr. 146-148). A witness acknowledged that a right angle drill was at the work location but contended it had not been used on the day of the inspection (Tr. 146). The testimony of the employee present at the site, that the right angle drill had not been used that day is credited.

There is no dispute, however, that the right angle drill, which was not double insulated, was at the same location as the ungrounded extension cord and was available for use (Tr. 141, 146). There is no indication the right angle drill had been effectively removed from service. It is sufficient to establish a violation, as here, that the employee was exposed to the hazard by being permitted access to the potentially hazardous condition. Giles & Cotting, Inc., 76 OSAHRC 30/D9 (4/1080), 3 BNA OSHC 2002, 1975-76 CCH OSHD ¶ 20,448 (Docket No. 504, 1976).

The Compliance Officer further testified, firmly and convincingly, that the ungrounded extension cord, itself, presents a shock hazard regardless of the type tool attached to it (Tr. 177-179).

By permitting employees to use an ungrounded extension cord and by permitting access to a tool, which if used with the cord would expose employees to the danger of electrical shock, respondent violated 29 C.F.R. § 1926.401(c). That regulation provides as follows:

> "(c) Effective grounding. The path from circuits, equipment, structures, and conduit or enclosures to ground shall be permanent and continuous; have ample carrying capacity to conduct safely the currents liable to be imposed on it; and have impedance sufficiently low to limit the potential above ground and to result in the operation of the overcurrent devices in the circuit".

Complainant charges the violation is a repeated one, within the meaning of Section 17 of the Act because a previous citation alleging a violation of 29 C.F.R. § 1926.401(c) has become a final order of the Commission (Exhibit G-8; Tr. 81-84).

Exhibit G-8 is a copy of a citation issued to respondent following an inspection of its worksite at 1300 Century Circle, North, Springdale, Ohio. Item four of the citation states as follows:

> "29 C.F.R. 1926.401(c): The path from circuits, equipment, structures, conduit, or enclosure to ground did not have impedance sufficiently low to limit the potential above ground and to result in the operation of the overcurrent devices:
>
> > There was an employee using a portable saw which was connected to a temporary service which had in excess of six (6) ohms resistance to ground".

Official Notice is taken of records of the Review Commission which show that a settlement agreement was entered in the case (Docket No. 78-963) in which respondent withdrew its notice of contest. The alleged violation of 29 C.F.R. § 1926.401(c) was affirmed by order of Judge Cecil L. Cutler, Jr., dated July 24, 1978 (Exhibits A, B, C, & D, attached to complainant's brief).

The same standard, 29 C.F.R. § 1926.401(c), was involved in the 1978 case and the current proceeding (Tr. 82-84, 90-92). Although the language used to describe the violations is substantially different in the two citations, both involve inadequate grounding of electrical equipment. The 1978 citation alleged an insufficient ground as the impedence was too high to trip a circuit-breaker should a short or ground fault occur (Tr. 91). The current violation is a failure to have any ground because of the missing prong of the extension cord.

In a significant decision defining the term "repeated", the Review Commission held as follows:

> "A violation is repeated under Section 17(a) of the Act if, at the time of the alleged repeated violation, there was a Commission final order against the same employer for a substantially similar violation ... The Secretary may establish a prima facie case of similarity by showing that the prior and present violations are for failure to comply with the same standards". Potlatch Corporation, 79 OSAHRC 6/A2, 7 BNA OSHC 1061, 1979 CCH OSHD ¶ 23,294 (Docket No. 16183, 1979).

In this case the same standard has been cited as previously; and although the language is different, both involve defective electrical grounding. As the violations are substantially similar, the Secretary has established a prima facie case of repeated violations, and the respondent has not rebutted that showing. Accordingly, a repeated violation has been proved.

A proposed penalty of $480.00 was recommended by the Secretary (Tr. 87-88). The evidence shows that the defective extension cord was accessible, but the evidence is in conflict whether it was attached to a non-double insulated tool or whether it had been used on the day of the inspection. In any event, the condition was corrected immediately (Tr. 139). The company has about 12 employees (Tr. 160-

161). Considering the gravity of the violation, which is limited in this instance, and the size, history and good faith of the employer, a penalty of $300.00 is warranted for this repeated violation.

## FINDINGS OF FACT

1. Respondent is an employer subject to the Act.

2. The Compliance Officer attempted to conduct an inspection of respondent's construction site on June 11, 1980, but no one was present to give the authorization to do so.

3. Consent was given for the Compliance Officer to wait in the employer's parking lot and, while waiting he observed with the aid of the zoom lens of a camera, three men riding in the bucket attached to a backhoe.

4. Riding in the bucket of backhoe is hazardous and is recognized as such (Tr. 55-57, 64, 66-67).

5. At the time the observations were made, as stated in paragraph three, the Compliance Officer did not have a warrant or the consent of the employer to conduct the inspection.

6. During the walk-around inspection, on July 7, 1980, after a warrant had been obtained, a defective extension cord was discovered in use which lacked a grounding prong. A non-double insulated tool was available and accessible for employee use.

7. The conditions described present the hazard of potential electrical shock to employees.

8. In the event of electrical shock, death or serious bodily injury would likely result.

9. A final order or the Review Commission for a substantially similar violation of 29 C.F.R. § 1926.401(c) is outstanding.

10. A penalty of $300.00 is appropriate for the repeated violation of 29 C.F.R. § 1926.401(c) under the conditions disclosed by the evidence considering the gravity of the violation and the size, history and good faith of the employer.

## CONCLUSIONS OF LAW

1. Testimony and other evidence arising directly from the observations of the Compliance Officer from respondent's parking lot on June 11, 1980, cannot be used to support an alleged violation of the Act.

2. The alleged violation of Section 5(a)(1) of the Act, the general duty clause, must be vacated.

3. Respondent committed a repeated and serious violation of 29 C.F.R. § 1926.401(c).

4. A penalty of $300.00 is appropriate.

ORDER:

1. The alleged violation of Section 5(a)(1) is vacated.

2. The repeated violation of 29 C.R.F. § 1926.401(c) is affirmed.

3. A penalty of $300.00 is assessed.

Dated this 13th day of July, 1981.

OCCUPATIONAL SAFETY AND HEALTH REVIEW COMMISSION

| | |
|---|---|
| SECRETARY OF LABOR,<br><br>Complainant,<br><br>v.<br><br>SPECIAL COATING SYSTEMS OF NEW MEXICO, INC.,<br><br>Respondent. | OSHRC Docket No. 79-6605 |

DECISION

Before: ROWLAND, Chairman; CLEARY and COTTINE, Commissioners.

BY THE COMMISSION:

Administrative Law Judge Vernon Riehl granted a motion by the Secretary of Labor to vacate a notice of contest submitted by Special Coating Systems of New Mexico. The judge found that the citation was properly served and that the notice of contest was mailed after the expiration of the 15-working day contest period set by 29 U.S.C. § 659(a), section 10(a) of the Occupational Safety and Health Act of 1970, 29 U.S.C. §§ 651-678. The judge's decision was directed for review under 29 U.S.C. § 661(i), section 12(j) of the Act. We remand for further proceedings.

Special Coating Systems argues that the judge erred in finding that it was properly served. In its brief on review, it also argues for the first time that the Commission could entertain a late-filed notice of contest under Federal Rule

of Civil Procedure 60(b). 1/ The Secretary argues that the judge's holding should be affirmed and that Special Coating Systems does not allege sufficient grounds for relief under Federal Rule 60(b).

We decline to consider at this time whether the citation was properly served and whether the notice of contest was untimely. We consider it more prudent in this case to defer any review of those issues until an administrative law judge has had an opportunity to consider the employer's alternative request for relief under Federal Rule 60(b); if relief is afforded, it may then be unnecessary for the Commission to further review this case.

When this case was before Judge Riehl, the Commission's authority to entertain late notices of contest under Federal Rule 60(b) had not been established. The Commission had previously held that it could not grant relief under Federal Rule 60(b) if a notice of contest had not been timely filed. Plessey, Inc., 74 OSAHRC 77/C1, 2 BNA OSHC 1302, 1974-75 CCH OSHD ¶ 18,907 (No. 946, 1974). Only after this case was directed for review did the contrary rule emerge first in J.I. Hass Co. v. OSHRC, 648 F.2d 190 (3d Cir. 1981), and then in Branciforte

---

1/ Rule 60(b) states in part:

> On motion and upon such terms as are just, the court may relieve a party or his legal representative from a final judgment, order, or proceeding for the following reasons: (1) mistake, inadvertence, surprise, or excusable neglect; (2) newly discovered evidence which by due diligence could not have been discovered in time to move for a new trial under Rule 59(b); (3) fraud (whether heretofore denominated intrinsic or extrinsic), misrepresentation, or other misconduct of an adverse party; (4) the judgment is void; (5) the judgment has been satisfied, released, or discharged, or a prior judgment upon which it is based on been reversed or otherwise vacated, or it is no longer equitable that the judgment should have prospective applicable; or (6) any other reason justifying relief from the operation of the judgment. . . .

Builders, Inc., 81 OSAHRC 80/A5, 9 BNA OSHC 2113, 2117, 1981 CCH OSHD ¶ 25,591, p. 31,922 (No. 80-1920, 1981). Inasmuch as the parties may not have had a fair opportunity to present evidence on this specific form of relief and because it is more prudent to allow a judge to consider the matter first, we remand this case to the chief administrative law judge 2/ for further proceedings on whether relief under Federal Rule 60(b) should be afforded.

SO ORDERED.

FOR THE COMMISSION

Ray H. Darling, Jr.

Ray H. Darling, Jr.
Executive Secretary

DATED: MAY 26 1982

2/ Judge Riehl has retired.

OCCUPATIONAL SAFETY AND HEALTH REVIEW COMMISSION

| | |
|---|---|
| SECRETARY OF LABOR,<br>Complainant<br><br>v.<br><br>SPECIAL COATING SYSTEMS OF NEW MEXICO, INC.,<br>Respondent | OSHRC Docket No. 79-6605 |

ON BEHALF OF COMPLAINANT: ROCHELLE G. STERN, Esquire, U. S. Department of Labor, Office of the Solicitor, Kansas City, Missouri

ON BEHALF OF RESPONDENT: VICTOR E. CARLIN, Esquire, Moses, Dunn, Beckley, Espinosa and Tuthill, Alburquerque, New Mexico

STATEMENT OF CASE

The parties in the above-mentioned cause have submitted this case to me by stipulation.

This is an action wherein the Secretary seeks to vacate respondent's notice of contest to a serious citation alleging a violation of 29 CFR 1926.500(d)(2) because of respondent's alleged untimely filing of a notice of contest. If we determine that the Commission has no jurisdiction of this matter the Secretary seeks, in the alternative, affirmation of the citation, penalty proposed by the citation, and abatement action required for the violation referred to above.

STIPULATED FACTS

1. Respondent is a New Mexico corporation with its corporate headquarters and principle place of business located at 5904 Florence Road,

N. E., Albuquerque, New Mexico.

2. At the time of the compliance officer's inspection and when the citation in this case was issued, respondent was engaged as a painting subcontractor at the Jeffery Energy Center in St. Mary's, Kansas.

3. At the time of the alleged violation and at the time of the citation, respondent employed approximately 11 employees at the Jeffery Energy Center in St. Mary's, Kansas.

4. During the period from August 28, 1979, through August 30, 1979, an inspection was conducted at the Jeffrey Energy Center in St. Mary's, Kansas, by a compliance safety and health officer from the Wichita, Kansas Area Office.

5. A citation alleging a violation of 29 CFR 1926.500(d)(2) together with a notification of proposed penalty was issued on September 7, 1979, pursuant to section 9(a) of the Occupational Safety and Health Act of 1979 (29 U.S.C. 651 et seq.).

6. The citation and proposed penalty were mailed (return receipt requested) on September 7, 1979, to Special Coating Systems, P. O. Box C, St. Mary's, Kansas 66536.

7. The return receipt on said ciation and proposed penalty was signed September 11, 1979, by a Mr. Bruce Ault, an employee of the general contractor at the worksite, Austin Building Company.

8. The correct name of Special Coating Systems is Special Coating Systems of New Mexico, Inc., and its corporate headquarters is at 5904 Florence Road, N. E., Albuquerque, New Mexico.

9. Bruce Ault is not and never has been an employee or agent of Special Coating Systems of New Mexico, Inc.

10. The citation and proposed penalty were transmitted by Bruce Ault to Larry Holm, respondent's work crew foreman at St. Mary's, Kansas, on September 11, 1979.

11. Larry Holm, at all times material herein, has been a work crew foreman of Special Coating Systems at St. Mary's, Kansas. At no time has Mr. Holm been an officer of Special Coating Systems, and at no time has he been involved in the management of said corporation.

12. The citation and proposed penalty, in this case, was received at the corporate headquarters of Special Coating Systems of New Mexico, Inc., in Albuquerque, New Mexico, on October 3, 1979.

13. Respondent's notice of contest was mailed to the Wichita Area Office of the Occupational Safety and Health Administration on October 3, 1979, the same day the citation and proposed penalty were received at the corporate headquarters of Special Coating Systems of New Mexico, Inc.

14. By letter dated October 11, 1979, the Area Director of OSHA received a letter from Larry Holm to the effect that abatement of the aforementioned alleged violation at the Jeffrey Energy Center had been accomplished on the day following the inspection. The letter was written by Larry Holm and signed "Special Coating, Inc., Box C, St. Mary's, Kansas."

15. Said letter was written at the specific request of the OSHA compliance safety and health officer that inspected the Jeffery Energy Center on August 28, 29, and 30, 1979.

16. The law governing this case is the Occupational Safety and Health Act of 1970, federal administrative and judicial decisions

interpreting and applying said Act, and standards duly promulgated by the Secretary pursuant to section 6 of the Act.

## ISSUE

Whether the Review Commission lacks jurisdiction over this matter in light of section 659(a) of the Act.

## DISCUSSION

The Secretary contends that the language of section 10(a) of the Act is unequivocal, and, therefore, respondent is barred from challenging the citations and the Review Commission lacks jurisdiction over this matter. The facts demonstrate that the respondent's notice of intent to contest the citations and penalties was mailed and received beyond the 15 working days provided by the statute.

Further, operation of that provision of the Act does not depend on whether there was prejudice to either party, since the sanction of section 10(a) is statutory. To this we agree.

The Secretary contends that service in the instant case was proper and met the test applied by the Review Commission in B. J. Hughes, Inc., 7 BNA OSHC 1474, Docket No. 76-2165 (1979), which provided:

> . . . that the test to be applied in determining whether service is proper is whether the service is reasonably calculated to provide an employer with knowledge of the citation and notification of proposed penalty and an opportunity to determine whether to abate or contest.

Relying on NLRB v. Clark, 468 F.2d 459 (5th Cir. 1972), and American Football League v. National Football League, 27 F.R.D. 264 (D.Md., 1964), the Review Commission decided that "this approach is consistent with the test applied by the Courts in general when determining sufficiency of service in other areas of law.

Complainant contends that the citation and notification of penalty were forwarded to Larry Holm, respondent's job crew foreman, at the worksite in St. Mary's, Kansas, and that it is reasonable to assume that even though Mr. Holm was not a corporate official, that he should know what to do with the citation and penalty notice, i.e., "know to whom in the corporate hierarchy to forward the documents." B. J. Hughes, supra, at 1474. We agree with this reasoning. Generally, a work crew foreman is in the best possible position with respect to OSHA matters. Job foremen at a local worksite are familiar with the working conditions and practices at the site, and they also have actual knowledge of what transpired during an OSHA investigation. B. J. Hughes at p. 1475.

Holm was responsible for sending the notice to the OSHA Area Office reporting that abatement was accomplished, it also appears that he had management responsibilities over operations and employees at the job-site.

The respondent's return address given by Holm on his letter was a post office box in St. Mary's, Kansas, where the citation and penalty were originally sent by the OSHA Office. Also, respondent has not contended that the Secretary misled him in anyway regarding the time for filing the notice of contest.

It was not necessary for the Secretary to determine who in the corporate hierarchy should be served with the proper documents. Such a requirement places an unreasonable burden on the Secretary. There was valid service upon the responsible employee at a local worksite. The evidence of record demonstrates that the employer received its citation and notice of penalty, and it was, therefore, properly served. See

Kerr-McGee Chemical Corp., 4 BNA OSHC 1739 (1976). The stipulated facts reveal that the citation and penalty notification were received by respondent at its worksite on September 11, 1979.

Respondent's notice of contest was, therefore, untimely filed because it was sent and received beyond the 15 working days from receipt of the citation and notice of penalty at its worksite in St. Mary's, Kansas.

We have considered the respondent's arguments as set forth in his memoranda. The respondent's argument does not establish a proper notice of contest to the Secretary of Labor in the instant case.

The stipulated facts, in the instant case, indicate that the respondent through its job crew foreman, Larry Holm, received notice which was reasonably calculated to provide the employer with knowledge of the citation and notification of penalty, and sufficient opportunity to determine whether to abate or contest, all within the proper framework as set forth by the law.

Respondent through its own supervisory employee had sufficient notice of the citation and proposed penalty. To allow a situation to exist wherein the supervisory employee on the job were to hold back citations and later have the citations vacated because of his acts would be unconscionable insofar as proper implementation of the Act.

As the Commission said in the Hughes case: ". . . an employer always runs a risk that the authority it has delegated to its supervisory personnel will be misused to the company's detriment."

## DECISION

Based upon the above findings of fact and conclusions of law, it is

hereby ORDERED:

1. The Review Commission lacks jurisdiction over this matter in light of section 659(a).

2. The citation, proposed penalty, and abatement date have been affirmed by operation of law.

Date: September 18, 1980

OCCUPATIONAL SAFETY AND HEALTH REVIEW COMMISSION

| | |
|---|---|
| SECRETARY OF LABOR,<br>Complainant,<br>v.<br>MARSON CORPORATION,<br>Respondent. | OSHRC Docket No. 78-3491 |

DECISION

Before: ROWLAND, Chairman; CLEARY and COTTINE, Commissioners.

BY THE COMMISSION:

A decision of Administrative Law Judge David J. Knight is before the Commission for review under 29 U.S.C. § 661(i), section 12(j) of the Occupational Safety and Health Act of 1970, 29 U.S.C. §§ 651-678 ("the Act"). Judge Knight vacated item 1 of a citation alleging that the Respondent, Marson Corporation ("Marson"), committed a serious violation of the Act by failing to comply with the machine guarding standard at 29 C.F.R. § 1910.212(a)(1). 1/ Commissioner Cleary directed review on the following issue:

> Whether the administrative law judge erred in vacating the alleged serious violation of 29 C.F.R. § 1910.212(a)(1) on

---

1/ The standard states:

> § 1910.212 General requirements for all machines.
>
> (a) Machine guarding--(1) Types of guarding. One or more methods of machine guarding shall be provided to protect the operator and other employees in the machine area from hazards such as those created by point of operation, ingoing nip points, rotating parts, flying chips and sparks. Examples of guarding methods are--barrier guards, two-hand tripping devices, electronic safety devices, etc.

> the grounds that [Marson] exercised reasonable diligence and yet lacked knowledge of the presence of the violation?

For the reasons that follow we affirm item 1 of the citation.

I.

Marson, a manufacturer of autobody fillers, operates two Hockmeyer mixers at its Chelsea, Massachusetts plant. Following an incident in which a mixer operator, Soto, had his arm severed by the Hockmeyer no. 2 mixer, Marson was cited for failing to comply with 29 C.F.R. § 1910.212(a)(1) by exposing operators to the unguarded rotating parts and shear points of that machine.

The Hockmeyer no. 2 mixer consists of a cylindrical tank 4 feet in length and 2 feet in diameter fitted with three rotating mixing blades. The tank rests horizontally on four legs. Because the opening of the mixer is about 5 feet above the ground, employees must stand on a 3 foot high platform next to the mixer to feed materials into it. The opening in the top of the tank through which materials are fed into the tank measures 22 inches by 48 inches. Below the opening are mixer blades that rotate with a torque great enough to amputate hands and arms. To protect employees from the moving blades, but permit them to feed materials while the blades are moving, the Hockmeyer no. 2 is equipped with a steel grate or screen over the opening. The grate is held in place by its own weight. Material can usually be added to the mixer through the grate, but a section of the grate can be raised or the entire grate can be removed.

Marson's employees did not remove the grate when the machine was on except when Marglass (a fiberglass filler) was produced out of, among other things, fiberglass. This occurred perhaps once every two months. The grate was removed because fiberglass did not readily pass through it. O'Connor, one of Marson's mixer-operators operated the mixer without the grate. Thiboult, another operator, testified that he did so until he concluded that the practice was unsafe. Soto,

who had been employed by Marson for five days, did not use the grate and had his arm severed as he was emptying a bag of fiberglass into the mixer.

Both Fennessey, Marson's manufacturing manager and head of its safety committee, and Razzak, its technical director, testified that it was company policy that the grates be kept in place when the machine was in operation. Fennessey testified that the policy was enforced by the issuance of warning notices by foremen, and by holding regular safety meetings at which infractions of the policy could be brought to the attention of management by the employees. Fennessey also testified that he made safety tours of the plant. Razzak testified that he physically checked the plant at least once a day. Razzak also testified that technicians, such as Forman, were given a copy of a list of procedures entitled "Responsibilities of the Foreman in the Mixing Room Area" and were requested to write the instructions down as they understood them. 2/ Marson introduced a written transcription of its work rules that Razzak testified had been copied by Forman. Forman testified that the procedures reflected his perception of Marson's procedures but he was not certain it was his transcription. This handwritten document included the following commands:

> 2) With mixer off and screen removed, the stirred paste is added to mixer.

---

2/ This document directs the foreman "[t]o check, [that] anybody working in the mixing room uses the safety equipment. ([I]f any mixer [operator] is working with chopped fiberglass he should be double checked for safety equipment)." It also states that the "[m]ixer [operator] should add the white paste when the machine is not running" and directs the foreman to conduct "[r]andom check[s] of the lab technician [to determine] that he is following the procedures." Marson also introduced into evidence a set of instructions governing the manufacture of a number of body fillers. These instructions included a command to "be sure . . . the screen of the mixer is clean and in position" before starting a batch and not to "put your hands in the mixer or do any scraping when the mixer is running . . . or add any powder into the running mixer without the screen."

3) Mixer is placed on slow speed, the screen is replaced, polyester in flow valve is opened and flow meter is started.

Fennessey testified that O'Connor, a mixer, told him that he knew that operating the machine with the grate off was against company policy. A second employee, Thiboult, testified that he knew the practice was contrary to company policy but decided to comply with the rule because he realized the danger presented by the blades, not because of the policy. Forman, the technician in charge of training the mixer-operators and running the mixing room, testified that he observed employees adding material to the mixer with the grate off and the machine on. Soto, the injured employee, testified that he observed other employees pouring compounds into the Hockmeyer no. 2 while it was on and that he had never seen the Hockmeyer no. 2 with the grate on.

Judge Knight vacated the item. He found that Marson knew of the hazard presented by the machine, but did not know of the violative condition even though it exercised reasonable diligence. The judge credited the testimony of Razzak that Marson had a policy against running the machine with the grate on. He implicitly rejected Forman's testimony that he had never been told not to run the mixer with the grate off. He found that Forman and the other technicians, who were responsible for the training and supervision of the mixers, were aware of the dangers of operating a machine without a grate. The judge found nothing to indicate that Forman was inadequately trained. The judge also found that it had not been shown that Marson's safety program was inadequate and that the Secretary had not shown any specific action Marson could have taken to discover the violation.

II.

On review, the Secretary argues that Marson had actual knowledge of the violative condition through its supervisory employee Forman. The Secretary relies on Mercer Well Service, Inc., 77 OSAHRC 178/C6, 5 BNA OSHC 1893, 1977-78

CCH OSHD ¶ 22,210 (No. 76-2337, 1977). He contends that Forman was a supervisor because he was responsible for the training and supervision of employees in the mixing room and that if Forman had received proper instructions, he could have prevented the violations in this case. According to the Secretary, Marson's failure to provide proper instructions establishes a prima facie case of an employer's knowledge of its own acts or omissions.

The Secretary claims that in order to rebut such a prima facie case, Marson would be required to demonstrate that it had a consistently enforced safety program, supervisors adequately trained in safety matters and a mechanism for discovering safety violations. The Secretary argues that even if the command was given not to run the mixer with the screen off, the effectiveness of the rule's communication must be doubted because Marson's employees were either unaware of the rule or felt free to disregard it. Relying on Niagara Mohawk Power Corp., 79 OSAHRC 36/A2, 7 BNA OSHC 1447, 1979 CCH OSHD ¶ 23,670 (No. 76-2414, 1979), the Secretary also contends that because Marson had no mechanism to discover violations of its rules, it failed to enforce its safety program. He argues that detection of violations by the methods Marson employed--safety meetings at which infractions could be pointed out by employees and inspections by Razzak during which he could not actually see whether the grate was in place--would be only accidental.

In conclusion, the Secretary argues that even if the judge was correct in not imputing Forman's knowledge to Marson, he erred in concluding that the Secretary failed to prove a lack of reasonable diligence on Marson's part. The Secretary maintains that an employer "cannot fail to properly train and supervise its employees and then hide behind its lack of knowledge concerning their dangerous working practices," quoting Danco Construction Co. v. OSHRC, 586 F.2d 1243, 1247 (8th Cir. 1978).

On review, Marson urges us to affirm the judge's decision. It contends that it had no knowledge of a violation of the standard by its employees. Marson contends that its safety director and technical director, who conducted safety meetings and made tours of the plant, were unaware that the Hockmeyer #2 was operated without a grate. Marson also argues that because it was entitled to rely on Forman's knowledge of the requirement that no mixer be operated without its grate in place, it did not have constructive knowledge of the violation. To impute the knowledge of a non-management employee, such as Forman, of certain isolated violations of its rules, would Marson argues, amount to the imposition of strict liability.

Contrary to the Secretary's arguments, Marson contends that an ongoing, active safety program was in existence at its plant, and that it disciplined employees who violated its rules. Marson also argues, relying on the holding of the United States Court of Appeals for the Fifth Circuit in Floyd S. Pike Electrical Contractors, Inc. v. OSAHRC, 576 F.2d 72 (5th Cir. 1978), that it can only be held liable for an employee's conduct if that conduct "might have been precluded through feasible precautions concerning the hiring, training, and sanctioning of employees." Marson contends that it did everything it could have done to prevent the violations. It argues that it could not have been expected to discover the occasional violations of the standards unless a management level employee was present when the violation occurred. Thus, it claims that it exercised the degree of diligence required by the Act, and still did not know of the violation.

III.

Section 1910.212(a)(1) requires that employees be protected by a guarding method from the hazards of rotating blades. It is clearly applicable to the cited machine. On the day the alleged violation occurred, the standard was not

complied with because the screen was off and Soto was unprotected from the hazard of the rotating blades. See A.E. Burgess Leather Co., 77 OSAHRC 25/D6, 5 BNA OSHC 1096, 1977-78 CCH OSHD ¶ 21,573 (No. 12501, 1977), aff'd, 576 F.2d 948 (1st Cir. 1978). 3/

Marson claims that it did everything it could have reasonably done to prevent the violation. This claim raises the affirmative defense of unpreventable employee misconduct. In order to establish this defense, an employer must show that it has established workrules designed to prevent the violation, has adequately communicated these rules to its employees, has taken steps to discover violations, and has effectively enforced the rules when violations have been discovered. Jensen Construction Co., 79 OSAHRC 49/D3, 7 BNA OSHC 1477, 1479, 1979 CCH OSHD ¶ 23,664, p. 28,695 (No. 76-1538, 1979). Employees must be properly trained and supervised and must be made aware that the work rules will be enforced. See Danco Construction Co. v. OSHRC, 586 F.2d 1243, 1247 (8th Cir. 1978); see Daniel International Corp., 81 OSAHRC 57/A2, 9 BNA OSHC 1980, 1983, 1981 CCH OSHD ¶ 25,492, p. 31,790 (No. 15690, 1981), appeal filed, No. 81-7602 (5th Cir. July 21, 1981).

We conclude that Marson failed to establish that it adequately trained and supervised its employees and that its efforts to monitor compliance with its

---

3/ The judge did find that employees sometimes added fiberglass to the mixer when the screen was off and the mixer was in operation. However, he made no specific finding that the condition presented a hazard, that the standard was not complied with, or that any violation was serious within the meaning of the Act. While a remand to the judge might be necessary in some circumstances in order for the judge to make such findings, here the parties had an opportunity to make a complete record before the judge. Because the Commission has the ultimate authority for making findings of fact, it can make the necessary findings of fact where as here, the record is sufficiently detailed and credibility is not an issue. Franklin R. Lacy (Aqua View Apartments), 81 OSAHRC 7/A2, 9 BNA OSHC 1253, 1254, 1981 CCH OSHD ¶ 25,171, p. 31,073 (No. 3701, 1981). We enter our findings here on the issues not reached by the judge.

rule were adequate. Soto, a new employee, was not apprised of Marson's safety rule; and Forman, the technician in charge of training employees, was not shown to have been adequately supervised in his training duties. After Forman received his initial training, he apparently received no further supervision. Enforcement of the rule was problematic in other respects. Despite safety tours by Fennessey of unknown frequency and thoroughness, occasional visits to the mixing room by Razzak, and a requirement that foremen report rule violations to Razzak, mixer-operators regularly violated the rule when they poured fiberglass into the machine. When one of the operators decided to comply with the rule, he did so not out of fear that he would be observed or disciplined but out of fear of the danger of the unguarded blades. Marson's safety meetings could not be relied on because it was the employees who were expected to raise the matter. Although Razzak was asked by Marson's counsel what would occur if he found an employee violating the rule, Razzak did not testify that infractions would result in disciplinary action. In short, we find that Marson had ineffective means of determining if its rule was followed and that employees were not made aware that the rule would be enforced. 4/

IV.

We also find that the violation was serious within the meaning of section 17(k) of the Act, 29 U.S.C. § 666(j). 5/ Marson failed to adequately implement

---

4/ In view of our finding that Marson failed to adequately implement its safety rule we need not reach the issue of whether Forman was a supervisor.

5/ That section provides:

> For purposes of this section, a serious violation shall be deemed to exist in a place of employment if there is a substantial probability that death or serious physical harm could result from a condition which exists, or from one or more practices, means, methods, operations or processes which have been adopted or are in use, in such place of employment unless the employer did not, and could not with the exercise of reasonable diligence, know of the presence of the violation.

its safety rule and thus could, with the exercise of reasonable diligence, have known of the violation. See Niagara Mohawk Power Corp., 7 BNA OSHC at 1450, 1979 CCH OSHD at p. 28,703. In addition, the compliance officer testified that an amputation could occur if the mixer opening was not covered. This unrebutted testimony, along with the fact that an amputation occurred, establish a substantial probability of serious physical harm within the meaning of the Act. See Ralston Purina Co., 79 OSAHRC 22/C11, 7 BNA OSHC 1302, 1979 CCH OSHD ¶ 23,507 (No. 76-2551, 1979).

In considering the appropriate penalty, we note that the gravity of this violation is moderately high. Under the circumstances of this case, we find that the $490 penalty recommended by the Secretary is appropriate.

Accordingly, the judge's decision is reversed. We affirm item 1 of the citation and find Marson in serious violation of the Act for failing to comply with 29 C.F.R. § 1910.212(a)(1). We assess a penalty of $490.

SO ORDERED.

FOR THE COMMISSION

Ray H. Darling, Jr.

Ray H. Darling, Jr.
Executive Secretary

DATED: MAY 27 1982

ROWLAND, Chairman, Dissenting:

I dissent from the majority's decision to reverse the judge and affirm the citation in issue. Under Commission precedent, a violation of the Act cannot be found unless the Secretary establishes as part of his case that the employer knew or with the exercise of reasonable diligence could have known of the presence of the violation. Prestressed Systems, Inc., 81 OSAHRC 43/D5, 9 BNA OSHC 1864, 1981 CCH OSHD ¶ 25,358 (No. 16147, 1981); General Electric Co., 81 OSAHRC 42/A2, 9 BNA OSHC 1722, 1981 CCH OSHD ¶ 25,345 (No. 13732, 1981); and cases cited therein. See M. Rothstein, Occupational Safety and Health Law, §§ 76-77 (1978). As the majority correctly observes, the violation in this case occurred when an employee, Soto, was injured by the rotating parts of a machine as a result of his operating the machine without using a guarding device, the metal grate which Marson has provided. 6/ As explained more fully below, Marson did not have actual knowledge of this violation because its supervisory personnel were not present when Soto operated the mixer in this manner. Since the Secretary also failed to demonstrate any defect in Marson's safety program, he has not shown any circumstances sufficient to put Marson on prior notice that an employee might operate the mixer without the grate in place. Therefore, the Secretary has not shown that Marson either knew or reasonably could have known of the violation. The judge properly decided the case, and his decision should be affirmed.

Review of the judge's decision was requested, and directed, on the issue whether the judge erred in finding that Marson lacked knowledge of the violation,

---

6/ The judge concluded that Marson provided an adequate guarding device, and he characterized the gravamen of the Secretary's charge as failure by Marson to require the use of this guard. Regardless whether, as the majority claims in note 3 of the lead opinion, the judge failed to make the necessary factual findings, the majority does not dispute the judge's characterization of the issue.

and in their briefs both parties discuss whether or not the facts of record establish such knowledge. Therefore, the only issue properly before the Commission in this case is factual, and in deciding the issue the Commission need do no more than determine whether the evidence of record supports the judge's disposition. See E.I. duPont de Nemours & Co., 82 OSAHRC , 10 BNA OSHC 1320, 1325, 1982 CCH OSHD ¶ 25,883 at 32,381 (No. 76-2400, 1982).

Nevertheless, the majority does not decide this case on the factual issue presented. Rather, the majority injects an issue not directed for review and not briefed by the parties; that is, whether Marson established a supposed affirmative defense of "unpreventable employee misconduct." By deciding the case on this issue, the majority shifts the burden of proof on an essential element of a violation from the Secretary to the employer. 7/ Since this action is contrary to the precedents noted above, as well as to the fundamental principle that the Secretary has the burden of proof in our proceedings, 8/ I must dissent.

I.

The above cited cases supporting the proposition that employer knowledge of a violation is an essential element of the Secretary's case are but a recent expression by the Commission of a long-established principle that the Act does not impose strict liability on employers. As was stated in Prestressed Systems,

---

7/ The majority cursorily acknowledges the element of knowledge as a part of the Secretary's case by concluding that the violation was serious in nature under 29 U.S.C. § 666(j) because Marson could have known of it, based on Marson's supposed failure to adequately implement its safety rule. However, at no point in the lead opinion does the majority consider whether the Secretary affirmatively demonstrated that Marson did in fact have knowledge of the violation. Rather, the majority's conclusion that Marson did not adequately implement its safety rule is based on the determination that Marson failed to prove as an affirmative defense that it had an adequate safety program. Since the majority applies the wrong legal test in resolving the question of employer knowledge, its finding must be rejected.

8/ See Commission rule 73(a), 29 C.F.R. § 2200.73(a).

supra, "[t]he Commission has found the burden of proving knowledge to be on the Secretary in furtherance of the Congressional intent that employers only be held responsible for hazards they can reasonably be expected to prevent" (citing cases). 81 OSAHRC 43/D5, p. 11, 9 BNA OSHC at 1868-69, 1981 CCH OSHD ¶ 25,358 at 31,500. 9/

The type of evidence which satisfies this burden will vary depending upon the nature of the violation in issue. In this case, the violation is not the result of any defect in the machinery used by Marson's employees or any failure by Marson to provide appropriate safety equipment. Rather, the violation is based on an employee's failure to use a safety device which Marson had provided. In this situation, the scope of Marson's duty must be measured according to the principle that the Act does not make Marson an insurer or guarantor of proper employee conduct. Brennan v. OSHRC (Raymond Hendrix), 511 F.2d 1139 (9th Cir. 1975). Accord, Horne Plumbing & Heating Co. v. OSHRC, 528 F.2d 564 (5th Cir. 1976). However, in view of the fact that an employer normally acts through its agents, the actions and knowledge of Marson's supervisory employees would be imputed to it, and Marson would be responsible if they have knowledge of the violation. E.g., Floyd S. Pike Electrical Contractor, Inc., 78 OSAHRC 50/E1, 6 BNA OSHC 1675, 1978 CCH OSHD ¶ 22,805 (No. 3069, 1978).

As a result, the Secretary could have established a prima facie case of employer knowledge by demonstrating that a supervisory employee personally observed or reasonably could have observed Soto's misconduct. Ted Wilkerson, Inc., 81 OSAHRC 70/D8, p. 9, 9 BNA OSHC 2012, 2016, 1981 CCH OSHD ¶ 25,551 at

---

9/ As the court noted in Brennan v. OSHRC (Raymond Hendrix), 511 F.2d 1139, 1145 (9th Cir. 1975), "[f]undamental fairness [requires] that one charged with and penalized for violation [sic] be shown to have caused, or at least to have knowingly acquiesced in, that violation. Under our legal system . . . no man is held accountable, or subject to fine, for the totally independent act of another."

31,856 (No. 13390, 1981); Minotte Contracting & Erection Corp., 78 OSAHRC 15/D4, 6 BNA OSHC 1369, 1978 CCH OSHD ¶ 22,551 (No. 15919, 1978). However, in order to avoid the imposition of strict liability, Marson could then rebut the Secretary's case by showing that it took all necessary precautions to prevent the hazardous misconduct by the employee. Floyd S. Pike, supra; Rothstein, supra, § 78 (Supp. 1981). Indeed, this principle, that the employer may rebut the Secretary's showing based on the imputation of the knowledge of a supervisory employee, not only is acknowledged in the Secretary's brief filed in this case but was recently reaffirmed by a divided Commission in H.E. Weise, Inc., 82 OSAHRC , 10 BNA OSHC 1499, 1982 CCH OSHD ¶ 25,985 (No. 78-204, 1982). 10/

---

10/ Unfortunately, in some cases the Commission has used the term "defense" in referring to the employer's introduction of evidence in rebuttal to the Secretary's showing. E.g., Floyd S. Pike Electrical Contractor, Inc., 78 OSAHRC 50/E1, 6 BNA OSHC 1675, 1978 CCH OSHD ¶ 22,805 (No. 3069, 1978). In other instances including the case now before us, the Commission has further expressly created and identified a specific "affirmative defense" for the characterization of the employer's introduction of such evidence. Use of the term "defense" is at best misleading; the identification and application of an actual "affirmative defense" is contrary to the fundamental rule imposing the burden of proof on the Secretary. Clearly, in presenting its evidence regarding the adequacy of its safety program the employer is not discharging a separate and distinct affirmative defense. Rather, the employer is simply assuming the burden of going forward with evidence in response to the Secretary's case-in-chief. See generally Raymond Hendrix, supra note 9. The difference between the burden of going forward with the evidence and the burden of proof of an affirmative defense is not one of mere semantics but rather can be one of substantive significance.

For example, as rebuttal to the Secretary's case, the employer's showing that it took reasonable steps to prevent the occurrence of the violation need not be specially pleaded. An "affirmative defense" of "unpreventable employee misconduct," however, under Fed. R. Civ. P. 8(c) must be raised in the employer's answer. Furthermore, since the burden of proof remains on the Secretary, the employer may move for dismissal without adducing any evidence if it feels that the Secretary's case-in-chief is insufficient to show knowledge. See former Commissioner Barnako's concurring opinion in Texland Drilling Corp., 80 OSAHRC 106/C13, 9 BNA OSHC 1023, 1980 CCH OSHD ¶ 24,954 (No. 76-5307, 1980).

In this case, however, as explained below, the violation was committed by nonsupervisory employees under circumstances where their supervisor did not observe and could not have reasonably observed the employee misconduct. Therefore, knowledge cannot be found unless there is specific evidence to demonstrate that the employer's safety program was inadequate. Howard P. Foley Co., 77 OSAHRC 90/A2, 5 BNA OSHC 1501, 1977-78 CCH OSHD ¶ 21,862 (No. 13244, 1977); Scheel Construction, Inc., 76 OSAHRC 138/B6, 4 BNA OSHC 1824, 1976-77 CCH OSHD ¶ 21,263 (No. 8687, 1976). 11/

II.

I conclude that the Secretary has failed to satisfy his burden of proof that Marson knew or reasonably could have known that its employee, Soto, would operate the machine in an unsafe manner. Neither of Marson's supervisory personnel, Fennessey, its safety officer, nor Razzak, the technical director, observed Soto's actions, nor is there any evidence to show that at the time the violation occurred either Razzak or Fennessey were located in a position from which they reasonably could have observed Soto in the performance of his work.

The Secretary contends, however, that the knowledge of Forman, the technician, should be imputed to Marson. I disagree because in my view the Secretary has failed to show that Forman is a supervisory employee whose knowledge may properly be imputed. 12/

---

11/ Indeed, the Commission has recognized that because the safety and health of employees is entrusted to their supervisors, an employer has a heightened duty to ensure the proper conduct of supervisory personnel. Floyd S. Pike, supra note 10. It necessarily follows that since the Secretary is unable to show that the violation occurred through the actions or with the knowledge of supervisory employees, he must present other evidence to demonstrate that Marson could have prevented the violation.

12/ The majority does not address the question of Forman's status, although they conclude that he was inadequately supervised in the execution of his training responsibilities.

According to Razzak, Forman's duty is to assure quality control by periodically checking and testing the mixture in the tank. Documents describing Forman's duties in more detail state that in checking and correcting the mixture the technician is subject to the supervision of another employee designated as the "foreman." Razzak's testimony further shows that the foreman in the mixing room, rather than the technician, is responsible for informing Razzak of any employee violations of Marson's safety rules. Accordingly, while the technician has some authority to direct the performance of the work, this authority is very limited and is subject to the overall control of another employee. Since technician Forman was not shown to have any responsibility to control the work for purposes of safety or compliance with OSHA standards, he cannot be considered a supervisory employee under Commission precedent. 13/

Thus, I cannot agree with the Secretary's argument that Forman should be considered a supervisory employee simply because he was responsible for giving instructions to mixer operators including Soto. Acceptance of the Secretary's argument would necessarily mean that any employee who gives on the job training to another automatically becomes a supervisor whose knowledge is imputed for purposes of the Act without regard to whether that employee has any responsibility to ensure compliance with the employer's safety rules. Since the record does not show that Forman had any authority to remove employees or take other

---

13/ Whether an employee is a supervisor for the purpose of imputing his action or knowledge to his employer depends not on the employee's formal title or designation but rather on the actual duties discharged by the employee. In order for the employee to be considered a supervisor for this purpose he must have the responsibility to direct other employees in the performance or completion of the work. In making this inquiry, the Commission has indicated that it will consider the extent to which the employee is responsible for insuring that the work is performed safely. Mercer Well Service, Inc., 77 OSAHRC 178/C6, 5 BNA OSHC 1893, 1977-78 CCH OSHD ¶ 22,210 (No. 76-2337, 1977); Iowa Southern Utilities Co., 77 OSAHRC 32/C10, 5 BNA OSHC 1138, 1977-78 CCH OSHD ¶ 21,612 (No. 9295, 1977).

appropriate action in the event employees were to disobey their instructions, I conclude that his knowledge should not be imputed to Marson. 14/

The record also does not establish that Marson otherwise should have been aware that Soto would operate the machine in a manner contrary to its work rules. As the majority opinion itself acknowledges, all of the employees who testified or whose statements appear in the record, with the arguable exception of Soto himself, were aware that material is not to be added to the machine when it is running without the grate in place. Insofar as Soto is concerned, Forman specifically testified that just prior to the accident he had explained to Soto step-by-step how the mixing operation was to be performed, and he had instructed Soto to turn the machine off at one particular point when material had to be added to the machine. Although it appears that Soto did not understand these instructions, Judge Knight nevertheless found that Marson could not reasonably have known that Soto was not sufficiently trained and supervised. The judge properly relied on the absence of any evidence to show that Forman himself was inadequately trained or was incapable of correctly instructing Soto. 15/

---

14/ I do not mean to suggest, however, that I would necessarily impose on an employer the burden to do anything more than give proper instructions to its employees. See note 16 infra. Nevertheless, so long as the Commission majority, as it does in this case, imposes on the employer a requirement to enforce compliance with established safety rules, I cannot agree to the imputation of knowledge to the employer unless it is shown that the employee whose knowledge is to be imputed is responsible for compliance with the safety rules on the part of other employees.

I further note that even assuming Forman were a supervisory employee whose knowledge may properly be imputed to Marson, the record fails to demonstrate that Forman knew of Soto's misconduct. Forman left the mixing room after having instructed Soto in the proper operation of the mixer. See the discussion in the text infra. There is no showing that Forman observed or reasonably could have observed Soto at the time the accident occurred.

15/ While the majority claims that Soto was not "apprised" of Marson's safety rule, it does not directly address the judge's finding regarding the training and supervision of Forman. Rather, consistent with its erroneous view that the burden of proof in this case is on Marson, the majority requires that Marson affirmatively demonstrate that Forman was in fact properly trained and supervised.

Nor does the record demonstrate that Marson's safety program is deficient in any other respect. Marson's safety rule was being violated in only a fraction of one percent of the total production operations performed in the facility, the production of Marglass, which occurs as infrequently as once every two months, whereas Marson's total production consists of 15 to 20 mixtures per day. Because of the extreme infrequency of the circumstances under which a violation may occur, it is patently unreasonable to expect Marson to predict and prevent every instance of its occurrence. See Borton, Inc., 82 OSAHRC , 10 BNA OSHC 1462, 1982 CCH OSHD ¶ 25,983 (No. 77-2115, 1982) (dissenting opinion). In these circumstances, Marson's regular safety meetings, the daily visits by Razzak into the mixing area, and Marson's practice of issuing warning notices to employees were sufficient measures to detect violations of the safety rules and enforce compliance with those rules. 16/ In any event, the Secretary, who has the burden of proof on the issue, has presented no evidence of any circumstances which could reasonably be considered to put Marson on notice of a defect in its safety program. 17/ Rather, the evidence demonstrates that Marson communicated safety rules to employees, the rules were understood by employees, and

---

16/ I do not mean to suggest, however, that I would necessarily place on an employer an obligation to do anything more in its safety program than establish and communicate safety rules to employees. Since I find Marson's mechanisms for detecting and imposing sanctions for violations of its safety rules adequate in the circumstances, I need not now consider whether an employer should be required to enforce as well as establish safety rules. See H.E. Weise, Inc., 82 OSAHRC , 10 BNA OSHC 1499, 1982 CCH OSHD ¶ 25,985 (No. 78-204, 1982) (dissenting opinion).

17/ Fennessey stated that at none of the safety meetings with employees, which are conducted regularly every month, had any mention ever been made of machines being operated without their grates in place. The first time Fennessey became aware that employees were violating the safety rule was during a conversation with employee O'Connor after Soto's accident, at which time O'Connor admitted that he had been violating Marson's safety rules. Similarly, Razzak testified that during his daily visits to the mixing room he had never seen the machine being operated with the grate

employees complied with the rules during the overwhelming majority of production operations. The judge so found, and I would affirm his decision to vacate the citation.

---

17/ (continued)

off. He explained that he can determine whether the grating is in place at any given time from the manner in which the employee holds the bag of material while emptying it into the machine and the ease with which the material pours into the machine's tank. Finally, Matz, Marson's president, informed the compliance officer that he was unaware that the employees were removing the grate.

UNITED STATES OF AMERICA

OCCUPATIONAL SAFETY AND HEALTH REVIEW COMMISSION

| | |
|---|---|
| SECRETARY OF LABOR,<br>Complainant<br>v.<br>MARSON CORPORATION,<br>Respondent | OSHRC DOCKET NO. 78-3491<br>DECISION & ORDER |

Appearances: For Complainant,
Albert H. Ross, Regional Solicitor
U.S. Dept. of Labor, Boston, MA.,
By: Eunice Chen Wray, Attorney

For Respondent,
Robert F. Sylvia, Esq.,
Fine & Ambrogne, Boston, MA.

Statement of Proceedings:

By letter dated July 27, 1978, Marson Corporation of Chelsea, Massachusetts (respondent), which manufactures automotive body fillers, contested[1/] a citation issued[1/] July 6 and amended (abatement period) on July 24, 1978, by the Occupational Safety and Health Administration of the U.S. Department of Labor (complainant or OSHA) alleging

---

1/ Under the Occupational Safety and Health Act of 1970, 29 U.S.C. §§651, et seq., citations are issued after an inspection [§658(a)] and may be contested within a 15 working day period [§659(a)].

serious[2/] violations of two safety standards. On May 9, 1978, in its main mixing room, an employee was exposed to the unguarded rotating parts (blades) and shear points while operating the Hockmeyer #2 mixing machine and respondent is charged in item 1 with not providing the guarding required by 29 CFR §1910.212(a)(1):

> (a) Machine guarding.
>
> (1) Types of guarding. One or more methods of machine guarding shall be provided to protect the operator... from hazards such as those created by... rotating parts... Examples of guarding methods are—barrier guards...

In item 2, the grates on four mixing machines were not affixed to the machines or secured elsewhere and respondent is charged with violating 29 CFR §1910.212(a)(2) which requires

> (2) General requirements for machine guards. Guards shall be affixed to the machine where possible and secured elsewhere if for any reason attachment to the machine is not possible. The guard shall be such that it does not offer an accident hazard in itself.

A proposed civil penalty of $490 was assessed for each allegation.

---

2/ A "serious" violation is one in which there is a substantial probability that death or serious physical harm may result unless the employer did not, or could not with the exercise of reasonable diligence, know of the presence of the violation. 29 U.S.C. §666(j).

The matter was heard on November 29, 1978, and both parties were represented by counsel with briefs and post-hearing requests filed by February 2, 1979. No affected employee came forward to claim party status after due notice (Transcript, Tr. 4). Respondent admits the jurisdictional facts and I conclude that the Commission's authority to decide this controversy is proper. 29 U.S.C. §§652(3), (5) and 653(a). It also agrees that the manner in which the inspection was carried out was proper. (Tr. 4-5).

The Issues:

The questions presented are:

Concerning item 1, whether respondent knew or could have known that the mixing machine was being operated with its grate or guard removed; and

Concerning item 2, whether the grates held in place by their own weight were "affixed" to the mixers.

The Evidence and Findings of Fact:

On May 9, 1978, respondent's employee Soto lost an arm in the Hockmeyer #2 mixing machine as he was adding a 25 pound bag of fiberglass to the machine while it was running and its protective grate was removed. The weight of the bag brought it within the vat, the machine's blade cut the bag and pulled his arm in. (Soto, Tr. 89-90). The batch being prepared was Marglass, a fiberglass body filler.

Patrick Cantino, an OSHA compliance officer, described the mixer as a cylinder type tank with three blades. His sketch, exhibit C-1, shows the tank and platform where the employee stands to add the

material through the top of the tank. The opening measures 29 by 48 inches. A grate rests in a ridge on this opening held there by its own weight completely covering the opening and in its center is a removable section measuring 20 by 48 inches through which samples of the batch being made can be taken. (Tr. 14-15 and 29) The employee's platform is three feet high and to the top of the vat is about five feet from floor level (Tr. 30-31). As one walks by this machine, he could not tell whether the grate was in place (Tr. 31). All four mixing machines in the mixing room have this guard (Tr. 12 and 29).

In an interview with an employee (O'Connor), Mr. Cantino was told that the Hockmeyer #2 is used only to mix the Marglass a couple of times a month. The grate is removed to add the fiberglass and it had to be done that way because the material would not go through the grate and the machine would be running. At the time of the accident the grate was not on the machine but it was only removed when making Marglass (Tr. 40-43).

This employee knew it was a violation of company policy to operate the machine with the grate removed (Tr. 44). When the grate is off while the machine is being cleaned it is not running nor is it when samples are taken through the grate's midsection (Tr. 45-46).

In his closing conference, Mr. Cantino was told by Mr. Matz, respondent's president, and Mr. Fennessey, its manufacturing manager, that the policy is to have the grates on at all times when the mixing machines are operating; they were installed as safety devices

because of the hazard presented by the rotating blades; that both men believed that the grates were so used; and that neither knew that the grates would be off while the machine was on (Tr. 52, 57-58). A technician (who would train a new employee) also told him that company policy is to leave the grates on (Tr. 44).

Based on the probability and type of an injury, the number of employees and length of time exposed, Mr. Cantino arrived at the net penalty proposed, $490 for each (Tr. 54). He considered the alleged violations as serious (death or serious physical harm resulting) and the employer knew of the hazard (Tr. 54-55). To a limited extent, he saw other parts of the plant but no condition for which he would recommend a citation (Tr. 58-60).

Bruce Thiboult has been a chemical compounder since February 1978. He has seen employees place materials in the mixer with the grate removed but he was not asked whether the machine was running at those times. When he placed fiberglass in with the grate off and the machine on, he didn't like that because it seemed too easy to slip so he put the grate on. He never has the machine running with the grate off. (Tr. 61-67) He was trained that way by the foreman and a technician, Stephen Foreman (Tr. 67-68). An operator has to get off the platform to reach the emergency switch (Tr. 64-65). And one cannot tell if the grate is on from floor level (Tr. 68). The fiberglass can be added through the grate and it is done that way now (Tr. 68-69).

Stephen Foreman has been a lab technician since September 29, 1977. He does not mix the batches and his function is to assure that the batch comes out right. His assignment in addition was to train

Mr. Soto as the mixer. Prior to May 9, 1978, the procedure for operating the mixer was to remove the grate, turn the machine on, add the materials, replace grate, turn the mixer on, and later to take the necessary samples (Tr 71-72, emphasis mine). Since that date, nothing is added to the machine without the grate in place.

Mr. Soto was a new employee at the time and Mr. Foreman was with him on the platform giving step-by-step instructions. One of these was to add a paste being sure to shut the mixer off. Mr. Foreman stated that he was not told not to leave Mr. Soto and he did not tell Mr. Soto that he should leave the grill on during the operation. Mr. Foreman left him for a minute or two and that was when the accident occurred. He has seen operators mixing Marglass without the grate in place. (Tr. 70-76 and 84)

Mr. Foreman was trained by Mr. Razzak, respondent's technical director, and denied that he was told to run the mixers only when the grate was on. However, if he were to prepare safety instructions for the preparation of batches and the operation of the mixers he would do the same as found on exhibit R-2 which he is not sure is in his handwriting. (Tr. 78-82) Item 2 on page one states, "With mixer off and screen removed..." materials are added. Item 3, "Mixer is placed on slow speed, the screen is replaced..." This would be after all materials are added. Item 8, "...the mixer is stopped, and the sides and top are blown..." In item 10, the cover referred to goes over the screen (Tr. 82). The same pattern follows for two other mixers in that room (page 3 of exhibit R-2).

Elexandro Soto, the injured employee, testified that he had been at work one week before the accident. Mr. Foreman gave him no instructions before the accident. Hockmeyer #2 has no grate; he never saw one. (Tr. 95-96) He received no written instructions when he began work but a man told him how to use the machine. He saw others mix with the Hockmeyer #2 and they never used the grate putting chemicals in while the machine was in operation. He couldn't reach the emergency switch from the platform (marked with an "X" on photo exhibit C-9). (Tr. 91-92, 94) Generally, Mr. Soto, because of language difficulties, had a problem with understanding questions and responding.

Concerning item 2 of the citation, the parties stipulated that the grates are removable, not bolted down, and fit in a ridge inside the mixer resting there on their own weight and they are heavy (Tr. 97 and 99). And complainant rested (Tr. 99).

Bruce T. Fennessey is respondent's manufacturing manager, head of its safety committee, he makes tours through the plant and organizes safety meetings. Respondent has 200 employees. The technical director (Mr. Razzak) controls the mixing room. Anytime the machine is on, the grate -- a single large plate made of cold roll steel and is heavy and awkward -- is to be in place. All products can be fed through it. After the accident in May 1978, Mr. Fennessey spoke with the other mixer there at the time (O'Connor) who admitted that operation without the grate violated company policy but it was easier to add the fiberglass. It had been done three or four times. Then Mr. Fennessey gave specific instructions that

nothing was to be added without the grate on the operating machine. Marglass is made once every two months.

Foremen will warn employees who violate a company rule. General safety committee meetings are held every month and every two weeks Mr. Fennessey meets with the foremen and safety will be one subject. At none of these meetings was it revealed that mixers were operated without the grates. (Tr. 99-109)

Abdul Razzak, respondent's technical director and supervisor of the mixing room formulates the products and gets them into production. All materials are to be added to the mixer through the grate otherwise the machine must be stopped. At no time was any opposite instruction given (Tr. 109-111) but it was emphasized not to run the mixer with no grate (Tr. 117). This is reflected in a written document, "Responsibilities of the Foremen in the Mixing Room" (exhibit R-4) in effect from November 1974 through June 1978 and on page 3, items 17e and 17f require the machine to be off when paste is added and the grates are to be in position when powder is poured in. This document is in both the foremen's and technician's folders. (Tr. 112) In addition, these men have instructions governing the preparation of colored fillers (exhibit R-5) and at several points are warnings not to run the machine with the grate off (Tr. 113-114). Neither of these are given to the mixers (Tr. 118-119). The technician, Stephen Foreman, has both of these documents and Mr. Razzak and others trained him in batch making. And Mr. Foreman, at Mr. Razzak's direction, prepared exhibit R-2 during his training period. (Tr. 114-117)

Mr. Foreman was charged with training Mr. Soto in the preparation of a new product and had no other duties in the mixing room (Tr. 119 and 125). Mr. Soto, in operating the mixer without the grate, violated company policy (Tr. 130). But the technician's bench is outside of the mixing room and he goes back and forth (Tr. 121) and Mr. Razzak will be in that room every day, sometimes twice (Tr. 126-127) but he doesn't check to see if the mixers are adquately trained; that is the technician's responsibility (Tr. 127). The lab people and foremen will be there and come to him with problems (Tr. 127).

Mr. Razzak never saw a machine running with the grate removed (Tr. 127). Although one cannot see the grate's position from the floor, he can tell by build ups on the grate and fluffing of powder whether it is in place (Tr. 122, 129, and 131-133). The fibrous material used in Marglass will not go through the grate and it is removed for the addition. But then the mixer is not running. (Tr. 122-124 and 130) This is also true for sampling and cleaning (Tr. 128). When the machine is on, so is the grate (Tr. 129). A mixer must come down from the platform to reach the emergency switch (Tr. 120).

Thereupon, the respondent rested (Tr. 137).

Based on this evidence and after considering the parties' post hearing proposals, I find:

1. Each of the four mixers in the mixing room is equipped with a heavy grate completely protecting the operator from contact with the machines' rotating blades and this was the case before and after May 9, 1978. Respondent was well aware of the hazard of operating these mixers and the proximity of the blades to the operator and

therefor provided the grates. The grates must be removed to clean and scrape the vat and based on the instructions in exhibits R-2, 4 and 5, this operation is not infrequent. When the vat is cleaned, the mixer is not running nor is it when samples of a batch being prepared are taken through the grates hinged midsection.

2. Up to May 9, all machines, save the Hockmeyer #2, were run with the grate in place and at no time would any machine be on with the grate off. These grates are located five feet from floor level when in place and cannot physically be seen by one passing by.

3. The Hockmeyer #2 is used to produce Marglass, a fiberglass filler, about once every two months and here I rely on the testimony of Mr. Fennessey.

4. The fiberglass used in Marglass is a fibrous material and does not readily pass through the grate. Some employees, prior to May 9, 1978, would add the fiberglass to the mixer while the blades were rotating with the grate removed. I base this finding on the O'Connor statements to the compliance officer and Mr. Fennessey and the testimony of Mr. Thiboult.

5. Mr. O'Connor, an operator of the mixing machines, knew that such a procedure was in violation of company policy and Mr. Thiboult had been trained not to do it and himself felt it was an unsafe procedure.

6. Neither the person totally in charge of plant safety nor the technical director who supervises the mixing room knew that employees added material to the operating Hockmeyer #2 with the grate off and the subject never came up at the monthly and biweekly meetings with

plant personnel and the foremen. When respondent learned that this machine was operated without the grate, at the time of the accident on May 9, 1978, immediately instructions were issued to stop that conduct in accordance with the company policy.

7. Technicians in the mixing room are responsible for production of the various batches and training and supervision of the employees who operate the mixers. The technicians in their own training period are made aware of the danger of running a mixer without the grate (¶4 of exhibit R-5) and of the company policy forbidding that practice. I accept Mr. Razzak's testimony on this point.

8. Stephen Foreman, a technician, was training Mr. Soto on May 9, 1978, in the production of Marglass and had no other function on that day. Mr. Soto is not fluent in English and Mr. Foreman did not sufficiently impress upon him the necessity for having the grate in place at all times when the machine was on. Mr. Soto's training and supervision was incomplete and imperfect and respondent was unaware of this. He had been employed only a week before his accident.

9. There is no evidence that Mr. Foreman, prior to May 9, 1978, was in anyway incompetent or lacking in ability to perform the functions assigned to him. Despite Mr. Soto's difficulty with understanding English, there is no evidence presented by complainant that respondent was on notice that more was required of it. Here, I do not accept complainant's proposed finding stating that "...there are blatant inconsistent policies and understanding of the working procedures of the Corporation [respondent]." (Brief pp 5-6) Mr. Foreman knew of

the danger of operating the mixer without the grate and the company policy forbidding that practice. There is no suggestion in this record that Mr. Foreman was inadequately trained or could not accomplish the proper training of Mr. Soto alone.

10. The grates used on these mixers are made of cold roll steel and are awkward, heavy and large and would not be easily removable.

Conclusions and Order:

Complainant argues, "Also the employer should have known of the violation, had it decided to examine the adequacy of their safety program, or lack thereof." (Brief, p. 9) But the facts do not support the contention that the safety program was inadequate. The practice -- which cannot be characterized as widespread but limited to a single operation on the Hockmeyer #2 every other month -- of running the machine without the grate was unknown to respondent. And complainant's evidence did not develop any specific acts by respondent which would have informed it of this occassional employee misconduct. Cf., Floyd S. Pike Electrical Contractor, Inc. v. OSHRC, et al, 576 F2d 72 (1978). Yet this is the complainant's burden. Brennan v. OSHRC, 511 F2d 1139 (1975), Ocean Electric Corporation v. Secretary of Labor, et al, 75 OSAHRC 84/E11, BNA 3 OSHD 1537, CCH ¶20,012.

It is not enough to show that respondent was aware of a hazard; it must be shown that it knew or should have known of a violation. That awareness is missing. I conclude that respondent was not in violation of 29 CFR §1910.212(a)(1) because it exercised reasonable

diligence and did not know of the violation.[3/] This item (no. 1) and its proposed penalty are vacated in the order below.

Regarding item no. 2 alleging a failure to "affix" guards to the machines, the quoted term has not been specifically defined by the Commission. In dealing with this standard, however, the Commission appears to have adopted a synonym

> Section 1910.212(a)(2) instructs the employer to attach guards to the machines... (emphasis mine) Secretary v. Buckeye Industries, Inc., 75 OSAHRC 21/B3, BNA 3 OSHD 1837, CCH ¶20339

And this implies something less than permanency suggested by the term affix. Thus the word means that the guard must be so placed in whatever manner to effectively protect the employee from the hazard created by the machine's operation. That a guard is removable (complainant's total evidence of a violation here) does not by itself violate this definition especially where the operation requires removal for certain operations such as cleaning the vat.

More positively, the weight, material and configuration of the guard resting on its ridge over the vat absolutely prevents contact between any extremity of the operator and the rotating blades. I conclude that the guards for these mising machines were affixed within the meaning of the standard. There is nothing in complainant's proof

---

3/ It appears that the alleged violation more exactly put would be a failure to require the use of the guard rather than a failure to provide it as charged. The point was not raised and, in view of my conclusion, makes no difference even if an amendment were offered. See, Secretary v. P & M Sales, 76 OSAHRC 52/A2, BNA 4 OSHD 1158, CCH ¶20,673.

or argument that more — such as a pressure switch on the ridge where the guard rests which would turn the machine off automatically if the guard is lifted — was intended. Respondent complied with the regulation and this item and proposed penalty are vacated in the order below.

Order:

Based on these findings and conclusions, it is ordered that the citation issued July 6, 1978, as amended July 24, 1978, alleging serious violations of 29 CFR §§1910.212(a)(1), item 1, and .212(a)(2), item 2, and proposing a civil penalty of $490 for each item is vacated.

DECISION

Before ROWLAND, Chairman; CLEARY and COTTINE, Commissioners.

BY THE COMMISSION:

This case involves two items of citations received by Consolidated Rail Corporation ("Conrail") following an Occupational Safety and Health Administration ("OSHA") inspection of Conrail's diesel shop in Buffalo, New York. One item alleged that Conrail violated 29 C.F.R. § 1910.22(c)[1/] by failing to cover or guard two locomotive repair pits. The pits were

---

1/ The standard provides in pertinent part as follows:

§ 1910.22 General Requirements.

* * *

(c) Covers and guardrails. Covers and/or guardrails shall be provided to protect personnel from the hazards of open pits, tanks, vats, ditches, etc.

within tracks on the floor of the engine house. This alleged violation was characterized as serious. The other item alleged that Conrail violated 29 C.F.R. § 1904.2(a)[2/] by failing to maintain a record of occupational injuries and illnesses at the shop.

The case was tried before Administrative Law Judge Foster Furcolo. Conrail argued that the working conditions cited in this case are exempt from the Occupational Safety and Health Act of 1970, 29 U.S.C. §§ 651-678 ("the Act"), under section 4(b)(1) of the Act, 29 U.S.C. § 653(b)(1).[3/] Judge Furcolo rejected Conrail's arguments and affirmed the two items.

Conrail petitioned for review of the judge's decision, continuing to argue preemption under section 4(b)(1). Conrail also argued that the repair pits item was not a serious violation. Former Commissioner Barnako

---

2/ This standard provides:

> § 1904.2 Log and summary of occupational injuries and illnesses.
>
> (a) Each employer shall, except as provided in paragraph (b) of this section, (1) maintain in each establishment a log and summary of all recordable occupational injuries and illnesses for that establishment; and (2) enter each recordable injury and illness on the log and summary as early as practicable but no later than 6 working days after receiving information that a recordable injury or illness has occurred. For this purpose form OSHA No. 200 or an equivalent which is as readable and comprehensible to a person not familiar with it shall be used. The log and summary shall be completed in the detail provided in the form and instructions on form OSHA No. 200.

3/ Section 4(b)(1) states, in pertinent part:

> Nothing in this chapter shall apply to working conditions of employees with respect to which other Federal agencies . . . exercise statutory authority to prescribe or enforce standards or regulations affecting occupational safety or health.

directed review of the judge's decision but limited the issues to whether OSHA recordkeeping requirements were preempted under section 4(b)(1) and whether the repair pits violation was serious. At the time review of this case was directed, the question of preemption of OSHA pit guarding requirements was controlled by the Commission's decision in Consolidated Rail Corp., 81 OSAHRC 8/A2, 9 BNA OSHC 1258, 1981 CCH OSHD ¶ 25,172 (Nos. 78-3100 et al, 1981), appeal filed, No. 81-1210 (1st Cir. Apr. 2, 1981), transferred, No. 81-4192 (2nd Cir. Oct. 2, 1981) (OSHRC No. 78-3100) and No. 81-2639 (3d Cir. Oct. 2, 1981) (OSHRC No. 78-4881) ("Conrail I"). It was this decision upon which Judge Furcolo based his opinion rejecting Conrail's section 4(b)(1) arguments.

However, in the time since Judge Furcolo issued his decision and order, the Commission has reconsidered Conrail I. In Consolidated Rail Corp., No. 79-1277 (Apr. 30, 1982) ("Conrail II"), a divided Commission decided that a policy statement by the Federal Railroad Administration ("FRA"), published at 43 Fed. Reg. 10,583-90 (March 14, 1978), was a sufficient exercise of statutory authority over the hazard of open pits associated with moving railroad equipment in railroad repair facilities to preempt OSHA standards requiring guarding for these repair pits. The pits involved in this case come within this category.[4/] Accordingly, applying Conrail II in this case, the repair pits item is preempted by

---

4/ Although we ordinarily will not decide issues which were not directed for review, see 29 C.F.R. § 2200.92(d), evenhanded administration of the Act requires that the scope of review be broadened in light of Commission precedent. See John T. Brady & Co., 82 OSAHRC 9/D10, 10 BNA OSHC 1385, 1982 CCH OSHD ¶ 25,941 (No. 76-2894, 1982).

the policy statement.[5/] We therefore reverse this portion of the judge's decision and vacate the item.

We turn now to the recordkeeping item. In Southern Pacific Transportation Co., 74 OSAHRC 82/A2, 2 BNA OSHC 1313, 1974-75 CCH OSHD ¶ 19,054 (No. 1348, 1974), aff'd, 539 F.2d 386 (5th Cir. 1976), cert. denied, 434 U.S. 874 (1977), a Commission majority held that the Department of Transportation's ("DOT") promulgation of regulations requiring the reporting of accidents was a sufficient exercise of statutory authority to exempt the railroad industry from compliance with OSHA regulations covering the same subject matter. Commissioner Cleary dissented. He reasoned that "exact recordkeeping of occupational injuries and illnesses was one of the major aims of the Act" and that "[a]lthough requiring the railroads to maintain OSHA records in addition to [DOT] records would involve some duplication, this is a small price to pay for assuring that accurate records of all workplace injuries and illnesses are maintained." 4 BNA OSHC at 1318, 1974-75 CCH OSHD at p. 22,789.

Although the FRA has the statutory authority to regulate the safety of railroad industry employees, see 45 U.S.C. §§ 421, 431, the entire railroad industry is not exempt from OSHA enforcement. See Southern Pacific Transportation Co. v. Usery, 539 F.2d 386 (5th Cir. 1976), cert. denied, 434 U.S. 874 (1977); Southern Railway Co. v. OSHRC, 539 F.2d 335 (4th Cir. ), cert. denied, 429 U.S. 999 (1976). Moreover, the FRA

---

5/ Commissioner Cottine would follow the precedent established in Conrail I that the FRA policy statement is not a standard or regulation within the meaning of § 4(b)(1) of the Act and therefore cannot operate to preempt the applicability of OSHA standards to railroad operations. See also Conrail II (Cottine, Commissioner, dissenting). Accordingly, he would affirm the § 1910.22(c) item for the reasons stated by the judge.

policy statement acknowledges that OSHA standards apply to certain working conditions in the railroad industry. See Conrail II, supra. Accordingly, OSHA continues to have an interest in information about occupational illnesses and injuries occurring in the railroad industry. OSHA's recordkeeping requirements are vital to increasing knowledge about occupational illnesses and injuries. See General Motors Corp., Inland Division, 80 OSAHRC 89/D2, 8 BNA OSHC 2036, 1980 CCH OSHD ¶ 24,807 (No. 76-5033, 1980). They allow OSHA to determine the need for future standards and pinpoint those workplace activities that warrant either increased or diminished enforcement efforts. See Puget Sound Tug & Barge, 81 OSAHRC 50/A2, 9 BNA OSHC 1764, 1778, 1981 CCH OSHD ¶ 25,373 at pp. 31,597-98 (No. 76-4905, 1981) (separate views of Commissioner Cottine).[6/] For these reasons, we believe that the railroad industry must comply with the OSHA recordkeeping requirements. Accordingly, we overrule the Commission's decision in Southern Pacific Transportation Co., supra, to the extent that it relieves the railroad industry of OSHA recordkeeping requirements.[7/]

---

6/ In Puget Sound, Commissioner Cleary concluded that the employer was not required to comply with OSHA recordkeeping requirements. However, he did so because in his view the working conditions of the seamen involved in Puget Sound were entirely exempt from OSHA enforcement and "it would be unnecessarily duplicative to require respondent to keep records for an area over which there exists a section 4(b)(1) exemption." 9 BNA OSHC at 1783, 1981 CCH OSHD at p. 31,602. As we have stated, the railroad industry is not entirely exempt from the Act.

Chairman Rowland did not participate in Puget Sound and does not adopt its holding.

7/ Chairman Rowland would not overrule Southern Pacific Transportation Co. on this issue. He agrees with the reasoning of the Commission majority in that case that OSHA lacks authority to enforce its recordkeeping requirements because the DOT (FRA) recordkeeping requirements

(continued on next page)

This does not mean that railroad industry employers must use the OSHA form, No. 200, mentioned in section 1904.2(a). Section 1904.2(a) allows an employer to maintain "an equivalent which is as readable and comprehensible to a person not familiar with it [as the OSHA 200 form]." See B.C. Crocker Cedar Products, 76 OSAHRC 132/B6, 4 BNA OSHC 1775, 1976-77 CCH OSHD ¶ 21,179 (No. 4387, 1976); Puterbaugh Enterprises, Inc., 74 OSAHRC 44/B11, 2 BNA OSHC 1030, 1973-74 CCH OSHD ¶ 18,158 (No. 1097, 1974). However, it is incumbent on the employer to insure that its forms contain information equivalent to OSHA form No. 200. In addition, the employer must afford the Secretary's representatives access to these records. See 29 C.F.R. § 1904.7.

Although we hold that railroad industry employers must comply with OSHA recordkeeping requirements, it would be unfair for us to hold Conrail in violation of the cited standard. Until now, Southern Pacific was the Commission precedent and under it railroad employers were not required to comply with OSHA recordkeeping requirements. We therefore vacate the recordkeeping item in this case. By this decision, Conrail and other railroad industry employees are now on notice that suitable

---

7/ (continued)

at 49 C.F.R. Part 225 preempt OSHA recordkeeping standards under § 4(b)(1) of the Act. Chairman Rowland also notes that in its policy statement, the FRA said "the railroad industry is subject to the FRA accident/incident reporting requirements and is, therefore, not subject to equivalent OSHA rules." 43 Fed. Reg. at 10,585, citing the Commission's decision in Southern Pacific Transportation Co. See Conrail II, supra. Therefore Chairman Rowland concludes that Conrail was not required to comply with the OSHA recordkeeping requirements. Thus he joins with Commissioners Cleary and Cottine who vacate the item in this case, as they discuss infra. In light of his decision to vacate the recordkeeping item, Chairman Rowland does not address Conrail's argument that it was not "required to prove to the [OSHA] compliance officer that it was reporting to the FRA."

records must be maintained and made available upon request to OSHA representatives.[8/]

FOR THE COMMISSION

Ray H. Darling, Jr.

RAY H. DARLING, JR.

|---|---|
| SECRETARY OF LABOR,<br>Complainant<br>v.<br>CONSOLIDATED RAIL CORP.,<br>Respondent | OSHRC DOCKET NO. 80-3495 |

APPEARANCES:

Douglas Weiner, Esq., for Complainant

Lorraine Staples, Atty., for Respondent

Joseph A. Stinger, Chairman, International Brotherhood of Boilermakers, Iron Ship Builders, Blacksmiths, Forgers and Helpers, for Employees

DECISION AND ORDER

This case arose under 29 USC, sec. 651 et seq. of the Occupational Safety and Health Act of 1970 (the Act). As a result of an inspection by the Occupational Safety and Health Administration [OSHA] of the Respondent's premises on or about June 3, 1980, Citations 1 and 2 were issued on or about June 5, 1980, charging that the Respondent violated sec. 5(a)(2) of the Act by the serious violation of the standards at 29 CFR 1910.22(c) and 29 CFR 1910.106(e)(6)(i) [respectively items 1 and 2 of Citation #1]; and the other than serious violation of the standards at 29 CFR 1904.2(a), 29 CFR 1910.22(a)(2) and .24(f) [respectively items 1, 2, and 3 of Citation #2].

At the Hearing, by stipulation, Citations 1 and 2 were amended by deleting the standard at 29 CFR 1910.106(e)(6)(i) from Citation #1 and adding it to Citation #2 (where, for the purposes of this case, it will be considered as Item 4 of Citation #2)...Tr. 4-6.

The Respondent filed Notice of Contest to Citations 1 and 2 and the penalties proposed therefor but, at the hearing, it was stipulated that sections (b), (d), and (e) of paragraph V of the Complaint [respectively, items 4, 2 and 3 of Citation #2] be affirmed...Tr. 4-6. At a later time in the hearing, the Respondent also stipulated that the violation alleged in section (c) of the Complaint [item 1 of Citation #2] was being contested solely on jurisdictional grounds...Tr. 104.

The pertinent sections of the Act and the standards are appended to this decision under appropriate titles.

29 CFR 1910.22(c) [Item 1 of Citation #1]

Since the parties were in agreement that the pits in question were not provided with covers or guardrails, the only issues contested were: (1) Did the Respondent establish the affirmative defense that section 4(b)(1) of the Act exempts the Respondent from the cited standards? (2) Was there a hazard of personnel falling into the open pits?

There was no real disagreement about the facts: the jobsite was 2 open diesel pits in the Respondent's engine house in its frontier yard in Buffalo; locomotives were brought over the pits on tracks flush with the floor of the engine house; the pits, which were within the tracks above, were about 120 feet in length by 4 feet in depth and about 44-46 inches in width; the locomotives had an overhang of about 1 to 1-1/2 feet on each side of the tracks; and when 4 locomotives were over the pits [which was the situation 90% of the time] there was no hazard to the Respondent's employees.

Although there was some disagreement among the witnesses as to the amount of water, oil, and grease in and around the pits, all agreed that the amount of such substances was considerable.

KNOWLEDGE

It was evident that the Respondent knew of the pits; in fact, one of its defenses apparently was that their location and its possible hazards were so visible that there was no real danger because everyone was familiar with the situation.

HAZARD

The very description of the pits indicates a hazardous condition where an employee could inadvertently walk into the pit or slip into it because of oil and grease in the area. A fall of 4 feet onto concrete could easily result in a serious injury. Even if there were no hazard 90% of the time (because of the presence of locomotives over the pits) the existence of the condition for even 10% of the time is enough to constitute a hazard.

FEASIBILITY

The hazard could easily be abated by the erection of guardrails or chains. The Compliance Officer's testimony to that effect was not contradicted or even seriously challeneged. In addition, the testimony indicated that guardrails were used by the Respondent for similar conditions in at least one of its other jobsites. Moreover, even the Respondent's witnesses testified that such abatement steps were feasible.

BEFORE CONRAIL 78-4881

Before the Review Commission opinion in Consolidated Rail Corporation [docket 78-4881, decided on February 2, 1981], I had prepared [but not rendered] a decision, the material part of which follows:

"SEC. 4(b)(1)

The Department of Transportation, acting through the Federal Railroad Administration (FRA) published the following Policy Statement in the Federal Register [43 Fed. Reg. 10583-10590]: "...FRA recognizes that OSHA is not precluded from exercising jurisdiction with respect to conditions not rooted in railroad operations nor so closely related to railroad operations as to require regulations by FRA..." [And later] "...OSHA regulations on guarding of open pits, ditches, etc., would not apply to inspection pits in locomotive or car repair facilities..."

In my opinion, that constitutes an exercise of authority by a federal agency (the FRA) sufficient to exempt the Respondent from the standard at 29 CFR 1910.22(c). The Policy Statement is not a vague general directive but is very specific language covering a very specific subject. It is not addressed to some generality that might happen at some undetermined time in the future; rather, it concerns a very limited industrial practice in a very limited situation that is taking place 90% of the time every day of the year in the type of business conducted by the Respondent. Under those circumstances, section 4(b)(1) of the Act is a good defense to the alleged violation of the standard at 29 CFR 1910.22(c)."

This is the decision I had planned to issue, together with the following alternate finding:

"ALTERNATE FINDING

If upon review it be decided that section 4(b)(1) is not a good defense, then I would affirm item 1 of Citation #1, the hazard being that employees often walked close to an open pit flush with a floor that usually had oily spots; and the hazardous condition could easily be abated by the erection of chains or

similar barrier during the estimated 10% of the time that the pit was not substantially covered by locomotives."

DECISION

As a result of the Review Commission opinion in Conrail 78-4881, that "Alternate Finding" now becomes the decision in this case.

1904.2(a) [Item 1 of Citation #2]

Since this item was contested only on jurisdictional grounds, the sole issue is whether the Respondent established the affirmative defense that section 4(b)(1) of the Act exempts the Respondent from the cited standard. That defense has not been established.

FINDINGS OF FACT

Having heard the testimony, observed the witnesses, and examined the exhibits, the following Findings of Fact are made:

1. At all times concerned, the Respondent regularly received, handled or worked with goods which had moved across state lines.

2. As concerns Item #1 of Citation #1, the Federal Railroad Administration published a Policy Statement in the Federal Register that OSHA regulations would not apply to inspection pits in locomotive repair facilities.

3. The open pits were a hazard when not covered by locomotives.

4. The conditions described in Item #1 of Citation #1 exposed the Respondent's employees to sustaining serious or fatal harm because of the hazard of falling into the pit.

5. One or more officers or supervisory personnel of the Respondent knew of the hazardous conditions described herein and knew that employees were exposed to such hazard.

5. The Respondent did not contest the merits of the violations alleged in Items # 1-4 of Citation #2.

## CONCLUSIONS OF LAW

1. At all times concerned, the Respondent was an employer engaged in a business affecting commerce within the meaning of the Act; and the Occupational Safety & Health Review Commission has jurisdiction over the subject matter and the parties.

2. At all times concerned, the Respondent knew, or with the exercise of due diligence should have known, of the alleged violations.

3. On the date in question, the Respondent was not in compliance with the standards cited and the Complainant has sustained the burden of proving the Respondent violated sec. 5(a)(2) of the Act (sec. 654).

## ORDER

The whole record having been considered, and due consideration having been given to 29 U.S.C., sec. 666(j), it is ordered:

1. Item 1 of Citation #1 is affirmed, and a penalty of $350 assessed therefor

2. Items 1, 2, 3, and 4 of Citation #2 are affirmed as other than serious violations.

SO ORDERED.

Foster Furcolo

FOSTER FURCOLO
Judge, OSHRC

Dated: March 10, 1981
Boston, Massachusetts

## APPENDIX

### THE ACT

Section 653 [section 4(b)(1) "Nothing in this Act shall apply to working conditions of employees with respect to which other Federal agencies...exercise statutory authority to prescribe or enforce standards or regulations affecting occupational safety or health."

Section 654 [section 5(a)(2)] Employer "...shall comply with occupational safety and health standards..."

Section 666 [section 17(b)] "...employer who has received a citation for a serious violation...of this Act...shall be assessed a civil penalty of up to $1,000 for each such violation."

Section 666 [section 17(c)] "...employer who has received a citation for a violation of...this Act...specifically determined not to be of a serious nature, may be assessed a civil penalty of up to $1,000 for each such violation."

Section 666 [section 17(j)] "...assess all civil penalties...giving due consideration to...the size of the business...gravity of the violation, the good faith of the employer, and the history of previous violations."

Section 666 [section 17(k)] "...a serious violation shall be deemed to exist...if there is a substantial probability that death or serious physical harm could result...unless the employer did not, and could not...know of the presence of the violation."

### The Standards

1904.2(a): A log of all recordable injuries was not kept [Citation 2, item 1]

1910.22(a)(2): Floors were not dry [Citation 2, item 2]

1910.22(c): "Covers and/or guardrails shall be provided to protect personnel from the hazards of open pits, tanks, vats, ditches, etc." [Citation 1, item 1]

1910.24(f): Stair treads were slippery [Citation 2, item 3]

1910.106(e)(6)(i): Precautions against flammable vapors were not taken [Citation 2, item 4]

| SECRETARY OF LABOR,<br><br>Complainant,<br><br>v.<br><br>DRAVO CORPORATION,<br><br>Respondent.<br><br>LOCAL 61, INTERNATIONAL UNION OF MARINE AND SHIPBUILDING WORKERS OF AMERICA,<br><br>Authorized Employee Representative. | OSHRC Docket No. 14818 |

DECISION

Before: ROWLAND, Chairman; CLEARY and COTTINE, Commissioners.

BY THE COMMISSION:

A decision of Administrative Law Judge David H. Harris is before the Commission for review pursuant to section 12(j), 29 U.S.C. § 661(i), of the Occupational Safety and Health Act of 1970, 29 U.S.C. §§ 651-678 ("the Act" or "OSHA"). In his decision, Judge Harris vacated a citation item alleging an other than serious violation of the Act in that Respondent, Dravo Corporation, failed to comply with 29 C.F.R. § 1916.51(a) at its pipe shop on Neville Island, Pennsylvania. 1/ The judge vacat-

---

1/ The cited standard was published in 29 C.F.R. Part 1916--Safety and Health Regulations for Shipbuilding. The standard provided:

§ 1916.51 Housekeeping.

(a) Good housekeeping conditions shall be maintained at all times. Adequate aisles and passageways shall be maintained in all work areas. All staging platforms, ramps, stairways, walkways, aisles, and passageways on vessels or drydocks shall be kept clear of all tools, materials, and equipment except that which is in use, and all debris such as welding rod tips, bolts, nuts, and similar material. Hose and electric conductors shall be elevated over or placed under the walkway or working surfaces or covered by adequate crossover planks.

(Footnote cont'd)

ed the item on the ground that 29 C.F.R Part 1916 did not apply to the working conditions in Respondent's pipe shop, including the cited working conditions. Specifically, the judge determined that Part 1916 was inapplicable because Respondent's pipe shop employees were not engaged in "shipbuilding or related employments on the navigable waters of the United States, including dry docks, graving docks and marine railways" within the meaning of 29 C.F.R. § 1916.2(d).

The issues before us on review are the following:

> (1) Whether the judge erred in vacating the citation on the ground that Respondent's pipe shop is not located on "the navigable waters of the United States, including dry docks, graving docks and marine railways."
>
> (2) Whether the judge erred in vacating the citation on the ground that Respondent's employees were not engaged in "shipbuilding" or "related employment."
>
> (3) If the judge erred in concluding that Part 1916 does not apply to Respondent's pipe shop, whether the citation should nevertheless be vacated on the ground that the cited standard applies only to working conditions "on vessels or drydocks."
>
> (4) If the cited standard applies to the cited working conditions, whether Respondent failed to comply with the standard.

For the reasons stated herein, we reverse the judge's conclusion that the inland location of Respondent's pipe shop precluded the application of Part 1916 to the working conditions in that shop. However, we affirm the judge's conclusion that Part 1916 was inapplicable because Respondent's pipe shop employees were not

---

(Footnote 1 cont'd)

The Secretary recently has consolidated and revised the standards that previously were published at 29 C.F.R. Parts 1915, 1916 and 1917. These revised standards have been promulgated as a new 29 C.F.R. Part 1915—Occupational Safety and Health Standards for Shipyard Employment. 47 Fed. Reg. 16984-17013 (April 20, 1982). The standard cited in this case and set forth above is now found at 29 C.F.R. § 1915.91(a). 47 Fed. Reg. 17002. In this decision, we will use the old designation for the cited standard, as well as for the other standards and regulations that we refer to that formerly were published in Part 1916.

engaged in "shipbuilding" or "related employment." For this reason, we affirm the judge's order vacating the citation item at issue. 2/

I

Respondent operates a large industrial complex engaged in steel fabrication and shipbuilding on Neville Island, Pennsylvania. The northern edge of the island and of the facility borders along "navigable waters of the United States," while a smaller channel of the river borders the southern edge of the island. The length of the complex, along the east-west axis, is approximately one-half mile. The distance from the main channel on the north to the structural shop on the southern side of the island is 900 to 1200 feet. Marine ways, boat launching facilities, and one of the two separate yards, where towboats and barges respectively are assembled, are located on the north side of the complex. The "most extremely north building on the property," located approximately 100 feet from the river and near the marine launching ways, is the pipe shop where the alleged violation occurred.

The pipe shop occupies most of a "T"-shaped building, including all of the "low bay," which forms the base of the "T," and approximately 70% of the "high bay." The remainder of the building is occupied by the mechanical erection department, a separate operation. The low bay is approximately 60 feet wide

---

2/ The four issues set forth above are before the Commission as the result of a direction for review issued by Commissioner Cleary and a supplemental briefing order issued by the Commission after review had been directed. In addition, former Commissioner Moran directed review of the judge's decision "for error." Notwithstanding this general direction for review, none of the parties have taken exception to the judge's decision and order insofar as it amends the citation item on review, vacates an alternative allegation of noncompliance with 29 C.F.R. § 1910.22(b)(2), and vacates a second contested citation item, item 4. There is also no compelling public interest warranting further review of those portions of the judge's decision that relate to those matters. Therefore, those portions of the judge's decision will not be considered on review. See Water Works Installation Corp., 76 OSAHRC 61/B8, 4 BNA OSHC 1339, 1976-77 CCH OSHD ¶ 20,780 (No. 4136, 1976); Abbott-Sommer, Inc., 76 OSAHRC 21/A2, 3 BNA OSHC 2032, 1975-76 CCH OSHD ¶ 20,428 (No. 9507, 1976). The described portions of the decision are accorded the significance of an unreviewed judge's decision. See Leone Constr. Co., 76 OSAHRC 12/E6, 3 BNA OSHC 1979, 1975-76 CCH OSHD ¶ 20,387 (No. 4090, 1976), appeal withdrawn, No. 76-4070 (2d Cir. May 17, 1976).

and 240 feet long. About 25 employees work in the pipe shop. Of these, 12 or 13 are welders and the rest are fitters, machinists, and pipe benders. The employees perform their work at tables set up in the pipe shop. They do not perform work outside of the pipe shop.

The pipe shop employees are engaged in fabricating pipe assemblies and also sub-assemblies, including rudders, Kort nozzles, sewage holding tanks and fittings. When pipe assemblies are completed, they are taken to storage areas in the boat-yards, to marine ways for direct installation in a barge or towboat, or to the structural shop. Completed sub-assemblies are sent to the structural shop for inclusion in larger assemblies. Approximately 90% of the pipe shop's production eventually is installed in towboats or barges assembled in the Respondent's yards. The remaining 10% is used in material handling machinery or plant maintenance.

Respondent's procedure for assembling vessels involves nine steps, taking 55 days from the initial step to launching. Additional work is done on the vessel after it has been launched. Generally, the assemblies fabricated by the pipe shop are completed and stored temporarily before the procedure for assembling the vessel begins.

The citation item at issue resulted from an inspection of the pipe shop by a compliance officer of the Occupational Safety and Health Administration. The cited conditions were located near the south wall of the low bay of the shop. Electrical lines, welding lead lines, oxygen hoses, and acetylene hoses extended from four welding machines placed along the south wall to work tables approximately ten feet from the machines. In addition, lines for four burning or cutting torches extended through the work area. These various hoses and cables crossed each other on the floor in a "spaghetti-like condition." According to the compliance officer, this intermingling of the hoses and cables created a tripping hazard to employees. On the day of the inspection, seven employees were working in the area in question.

II

The initial question to be determined is whether the scope of Part 1916 under OSHA was determined exclusively by the provisions of 29 C.F.R. § 1910.14, as argued by the Secretary on review, or whether it was also limited by the provisions of 29 C.F.R. §§ 1916.1 & 1916.2, as held by Judge Harris and argued by Respondent throughout this proceeding. The standards published at 29 C.F.R. Part 1916, including the cited standard, were originally promulgated by the Secretary as standards under the Longshoremen's and Harbor Workers' Compensation Act, 33 U.S.C. §§ 901-950 ("the LHWCA"). Subsequently, they were adopted as standards under OSHA pursuant to the authority granted to the Secretary in section 6(a) of the Act, 29 U.S.C. § 655(a). 3/ In his decision in this case, Judge Harris concluded that the standards in Part 1916 had "the same meaning, extent and application" under OSHA as they had under the LHWCA. Accordingly, he further concluded that the definition of the term "employee" in 29 C.F.R. § 1916.2(d) "controlled" the extent of an employer's duty under Part 1916, which duty was set forth in 29 C.F.R. § 1916.1(a). 4/ The judge then based his holding that Part 1916 is inapplicable to Respondent's pipe shop in part on his determination that

---

3/ Section 6(a) of OSHA provides, in pertinent part:

> Without regard to chapter 5 of title 5, United States Code, or to the other subsections of this section, the Secretary shall, as soon as practicable during the period beginning with the effective date of this Act and ending two years after such date, by rule promulgate as an occupational safety or health standard . . . any established Federal standard . . . .

The term "established Federal standard" is defined, in section 3(10) of the Act, 29 U.S.C. § 652(10), as "any operative occupational safety and health standard established by any agency of the United States and presently in effect, or contained in any Act of Congress in force on the date of enactment of this Act."

4/ 29 C.F.R. § 1916.1 was captioned "Purpose, scope, and responsibility." Section 1916.1(a) provided, in pertinent part:

> Section 41 of the Longshoremen's and Harbor Workers' Compensation Act requires every employer to furnish and maintain employment and places of employment which are reasonably safe for his employees in all employments covered thereby . . . . The purpose of this part [29 C.F.R. Part 1916] is to make

the shop is not "on the navigable waters of the United States, including dry docks, graving docks and marine railways" within the meaning of section 1916.2(d).

The Secretary takes exception to the judge's conclusion that former section 1916.2(d) "controlled" the extent of an employer's duty under OSHA. He contends that sections 1916.1 and 1916.2 were relevant only in determining the scope of Part 1916 under the LHWCA and that they did not affect the scope of those standards under OSHA. Respondent argues in support of the judge's analysis and his conclusions.

We conclude that the judge erred in relying on the definition set forth at 29 C.F.R. § 1916.2(d). The regulation adopting the Part 1916 standards as OSHA standards is published at 29 C.F.R. § 1910.14. Section 1910.14(a) is captioned "[a]doption and extension of established safety and health standards for shipbuilding" (emphasis added). It provides: 5/

> The standards prescribed by Part 1502 of this title and in effect on April 28, 1971, are adopted as occupational safety

---

(Footnote 4 cont'd)

> determinations under this standard with respect to shipbuilding activity. (Emphasis added).

29 C.F.R § 1916.2 was captioned "Definitions." Section 1916.2(d) provided:

> (d) The term "employee" means any person employed in shipbuilding or related employments on the navigable waters of the United States, including dry docks, graving docks and marine railways, by an employer as defined in paragraph (c) of this section.

These provisions do not appear in the recently-promulgated new Part 1915. See note 1 supra. However, the new Part 1915 contains comparable provisions that apparently were intended to have the same effect. See 29 C.F.R. §§ 1915.1, 1915.3(a) and 1915.4(c) & (d). 47 Fed. Reg. 16987. In particular, we note that § 1915.4(d), in defining the term "employee," retains the following language from § 1916.2(d): "person engaged in . . . shipbuilding . . . or related employments on the navigable waters of the United States, including dry docks, graving docks and marine railways . . . ."

5/ When the shipbuilding standards were issued under the LHWCA, they were published in 29 C.F.R. Part 1502. Part 1502 was redesignated as Part 1916 after the standards had been adopted under OSHA. We further note that the term "employee" as it is used in § 1910.14 is defined at 29 C.F.R. § 1910.2(d). Accordingly, the definition at § 1916.2(d), note 4 supra, was inapplicable.

> or health standards under section 6(a) of the Act and shall apply, according to the provisions thereof, to every employment and place of employment of every employee engaged in shipbuilding or a related employment. Each employer shall protect the employment and places of employment of each of his employees engaged in shipbuilding or a related employment, by complying with the appropriate standards prescribed by this paragraph. (Emphasis added).

Furthermore, at the same time the Secretary issued section 1910.14, he also issued 29 C.F.R. § 1910.11 [now § 1910.11(a)], which states:

> The provisions of this Subpart B [including section 1910.14] adopt and extend the applicability of, established Federal standards in effect on April 28, 1971, with respect to every employer, employee, and employment covered by the Act. (Emphasis added.)

Respondent argues and the judge agreed that, because section 1910.14(a) states that Part 1916 applied "according to the provisions thereof," the Secretary in adopting Part 1916 under OSHA also adopted the restrictions on its scope as set forth in sections 1916.1 and 1916.2. We disagree. Subpart B of Part 1910, which includes section 1910.14, also sets forth the following provision at section 1910.11(b):

> (b) It bears emphasis that only standards (i.e., substantive rules) relating to safety or health are adopted by any incorporations by reference of standards prescribed elsewhere in this chapter or this title. Other materials contained in the referenced parties [sic] are not adopted. Illustrations of the types of materials which are not adopted are these. The incorporations by reference of Parts 1915, 1916, 1917, 1918 in §§ 1910.13, 1910.14, 1910.15, and 1910.16 are not intended to include the discussions in those parts of the coverage of the Longshoremen's and Harbor Workers' Compensation Act or the penalty provisions of the Act. Similarly, the incorporation by reference of Part 1926 in § 1910.12 is not intended to include references to interpretative rules having relevance to the application of the Construction Safety Act, but having no relevance to the application to the Occupational Safety and Health Act. [Emphasis added].

It is clear that sections 1916.1 and 1916.2(d) were part of "the discussions in . . . [Part 1916] of the coverage of the Longshoremen's and Harbor Workers' Compensation Act." See note 4, supra and section 2(4) of the LHWCA, 44 Stat. 1424, 1425 (1927). We therefore conclude that the Secretary did not adopt sections

1916.1 and 1916.2(d) as standards under OSHA. Instead, he stated in section 1910.11(b) that these provisions were not adopted under OSHA. 6/

We further reject Respondent's contention that the Secretary had no authority under section 6(a) of the Act to adopt the standards in Part 1916 without also adopting the restrictions in sections 1916.1 and 1916.2(d). The Commission has consistently held that section 6(a) authorized the Secretary to extend "established Federal standards" beyond the jurisdictional limitations of the statutes under which the standards were initially promulgated. Brown & Root, Inc., 81 OSAHRC 17/D14, 9 BNA OSHC 1407, 1409, 1981 CCH OSHD ¶ 25,226 at p. 31,171 (No. 77-805, 1981) (29 C.F.R. Part 1915); Bechtel Power Corp., 76 OSAHRC 38/E2, 4 BNA OSHC 1005, 1008, 1975-76 CCH OSHD ¶ 20,503 at pp. 24,500-501 (No. 5064, 1976), aff'd, 548 F.2d 248 (8th Cir. 1977) (29 C.F.R. Part 1926); Lee Way Motor Freight, Inc., 74 OSAHRC 22/D12, 1 BNA OSHC 1689, 1691, 1973-74 CCH OSHD ¶ 17,693 at p. 22,088 (No. 1105, 1974), aff'd, 511 F.2d 864, 869 (10th Cir. 1975)(Walsh-Healey standards in 29 C.F.R. Part 1910). See generally, American Can Co., 82 OSAHRC / , 10 BNA OSHC 1305, 1982 CCH OSHD ¶ 25,899 (Nos. 76-5162 et al., 1982)(discussion of permissible and impermissible changes in established Federal standards). As indicated, the Secretary exercised this authority when he adopted Part 1916 and extended its application "to every employment and place of employment of every employee engaged in shipbuilding or a related employment."

Accordingly, we reverse the judge's conclusion that 29 C.F.R. § 1916.2(d) "controlled" the extent of an employer's duty under OSHA. Because the Secretary

---

6/ The Secretary recently reaffirmed his original intent in the preamble to the new Part 1915. See note 1 supra. Referring to his 1971 adoption of the LHWCA standards on ship repairing, shipbuilding and ship breaking as standards under OSHA, the Secretary stated, at 47 Fed. Reg. 16986:

> As was noted at that time, and as set forth in §§ 1910.13, 1910.14, and 1910.15, the adoption of these standards as OSHA standards did not incorporate those provisions which dealt with application or interpretation of the LHWCA. Several such provisions have continued to be published in Parts 1915 through 1917, but their relevance is limited to LHWCA, and they are not governing under OSHA. The consolidation of the shipyard standards which is being accomplished today does not affect this coverage.

did not adopt that section or section 1916.1, Part 1916 was not limited under OSHA to employment "on the navigable waters of the United States, including dry docks, graving docks and marine railways." For this reason, the judge erred to the extent that he relied on the inland location of Respondent's pipe shop as the basis of his holding that Part 1916 did not apply to working conditions in the pipe shop. 7/

III

Having determined that the scope of Part 1916 under OSHA was governed by 29 C.F.R. § 1910.14 and that Part 1916 therefore applied to "every employment and place of employment of every employee engaged in shipbuilding or a related employment," we must next determine whether the judge erred in concluding that the employees in Respondent's pipe shop were not engaged in "shipbuilding" or "related employment." The applicable definitions of these key terms are set forth in sections 1910.14(b)(1) & (2).8/ The terms are defined as follows:

> (1) "Shipbuilding" means the construction of a vessel, including the installation of machinery and equipment.

---

7/ In Dravo Corp. v. OSHRC & Marshall, 613 F.2d 1227 (3rd Cir. 1980), the United States Court of Appeals for the Third Circuit held that a structural shop on the same Neville Island was not covered by the shipbuilding standards. The court reversed a decision by a Commission administrative law judge that had not been reviewed by the Commission. In reversing the judge and finding the shipbuilding standards inapplicable, the court relied on the scope provisions of Subpart A of Part 1916, including the definitions of "employer," § 1916.2(c), and "employee," § 1916.2(d). In Part 1916, the definitions of "employer" and "employee" referred to the narrow situs term "navigable waters." The court noted its view that these definitions limited the coverage of Part 1916 under OSHA to "navigable waters . . . including dry docks, graving docks, and marine railways."

The narrow situs term "navigable waters" is not present in the scope or definition provisions of § 1910.14 and neither the Commission judge nor the Dravo court considered whether § 1910.14 was the exclusively applicable scope provision for Part 1916 under OSHA. Accordingly, the Third Circuit's opinion is not conclusive on this question. Cf. S.E.C. v. Chenery Corp., 332 U.S. 194 (1947)(Chenery II) (a reviewing court considers the propriety of an agency's action only on the grounds stated in the agency decision and the Court's previous reversal and remand of the agency's unsupportable action in Chenery I, 318 U.S. 80 (1943), did not preclude the agency from taking the same action on remand on other grounds supportable by law).

8/ Respondent argues that the applicable definitions of "shipbuilding" and "related employment" were those set forth in §§ 1916.2(i) & (j). For the

> (2) "Related employment" means any employment performed as an incident to, or in conjunction with, shipbuilding work, including, but not restricted to, inspection, testing trials, and employment as a watchman.

The Secretary contends that the employees working in Respondent's pipe shop were engaged in "shipbuilding" or "related employment." The Secretary emphasizes the following facts: (1) the pipe shop was located only 100 feet from the water, (2) the work performed by the employees furthered their employer's business of new ship construction, and (3) 90% of the pipe shop's production was eventually installed in towboats or barges assembled at Respondent's boatyards. The Secretary argues that these facts support a finding that the employees at issue were engaged in shipbuilding or, at the very least, "employment performed as an incident to, or in conjunction with, shipbuilding work" within the meaning of section 1910.14(b)(2), supra.

In particular, the Secretary urges us to draw an analogy to Commission decisions construing the term "construction work" as it is used in determining the scope of Part 1926. The Secretary cites the Commission's decisions in A.A. Will Sand & Gravel Corp., 76 OSAHRC 81/G2, 4 BNA OSHC 1442, 1976-77 CCH OSHD ¶ 20,864 (No. 5139, 1976), and in United Telephone Co. of the Carolinas, 76 OSAHRC 110/B14, 4 BNA OSHC 1644, 1976-77 CCH OSHD ¶ 21,043 (No. 4210, 1976). The Secretary asserts that, under those decisions, the test for determining whether an employee is engaged in "construction work" is whether his work is an integral part of the construction activities at the worksite. Analogizing to this test, the Secretary reasons that the work performed by the pipe shop employees was an integral part of the shipbuilding activities at Respondent's

---

(Footnote 8 cont'd)

> reasons stated in Part II of this opinion, we conclude that those definitions were not adopted under OSHA and that they are relevant only in determining the scope of Part 1916 under the LHWCA. Nevertheless, we note that the two sets of definitions are identical and that the terms "shipbuilding" and "related employment" accordingly have the same meaning under both OSHA and the LHWCA.

Neville Island workplace. Accordingly, the Secretary continues, the employees in the pipe shop were clearly engaged in covered activities.

Respondent urges us to adopt the judge's conclusion that its pipe shop employees were not engaged in "shipbuilding" or "related employment." It contends in effect that the term "shipbuilding" refers to the process of actually assembling a vessel. Thus, it notes that shipbuilding at its workplace is an integrated work process consisting of nine steps before flotation of the vessel and additional work aboard the vessel after flotation. It implicitly argues that this integrated work process is "shipbuilding" within the meaning of the term and that the pipe fabrication is not "shipbuilding" because it is not a part of this integrated process but rather is a separate production process.

In addition, Respondent asserts that its pipe shop employees were not engaged in a "related employment." Referring to the examples given in the definition of the term, i.e., "inspection, testing trials, and employment as a watchman," Respondent reasons that activities classified as "related employment" share two essential characteristics: (1) they are contemporaneous with the "actual" shipbuilding process and (2) they result in exposure to the same hazards arising from "actual" shipbuilding activity. In contrast, Respondent continues, the pipe fabrication involved in this case "precedes any actual shipbuilding activity," making it "remote" in both time and hazard potential from the types of employment classified as "related employment."

We agree with Respondent. Sections 1910.14(b)(1) & (3) describe "shipbuilding" as "construction of a vessel, including the installation of machinery and equipment", and "vessel" as "watercraft . . . capable of being used, as a means of transportation on water . . . ." The employees in Respondent's pipe shop do not construct vessels capable of being used in water. Rather, the employees cut sheet metal and pipe into "pre-assemblies", and also fabricate "sub-assemblies" such as rudders, nozzles and sewage holding tanks. Nor do the employees in the pipe shop install

machinery or equipment into vessels; such installation takes place across the street in the "barge shop" or the boatyard, usually after the "pre-assemblies" and "sub-assemblies" have been temporarily stored in an intermediate storage area.

Since the pipe shop operations are not "shipbuilding", the determinative issue is whether the employees in the pipe shop are engaged in "related employment." The plain meaning of the words in the definition of "related employment", as well as the whole regulatory scheme of former Part 1916, suggests that a variety of factors must be considered to determine whether the activities in Respondent's pipe shop constitute "related employment". See Berglund-Cherne General Contractors, 82 OSAHRC / , 10 BNA OSHC , 1982 CCH OSHD ¶ 26,039 (No. 79-4347, 1982) (regulations should be construed to give effect to the natural and plain meaning of its words); § 1910.14(b)(2) defines "related employment" as employment which is "incident to, or in conjunction with" shipbuilding; thus, we must consider whether the cited operations are contingent upon and occur simultaneously with the construction of a vessel. The examples of "related employment" listed in § 1910.14(b)(2)--such as inspections, testing trials, and watchmen duties--suggest that the nature or the type of work is a relevant factor. 9/ In addition, the entire regulatory scheme of the shipbuilding standards in Part 1916 addresses hazards which are unique to the immediate construction of ships. 10/ In our view, the following factors are relevant in determining whether employees are engaged in "shipbuilding" or "related employment": (a) the nature of the work being performed.

---

9/ Indeed, the construction cases relied upon by the Secretary look to the nature of the work when applying the "integral part" test. See United Telephone Company of the Carolinas, 4 BNA OSHC at 1645 (reconstruction of telephone lines constitutes "alterations", a term specifically used to define "construction work" in § 1910.12(b)); A.A. Will Sand, 4 BNA OSHC at 1443 (unloading of gravel onto conveyor hopper only as the gravel was needed for the roof repairs, constitutes "construction").

10/ For example: § 1916.32(f) refers to tank shells, decks, overheads, and bulk heads; § 1916.43(a), (b), (c), and (e) refer to deck openings, hatches, flotation devices and bilges; § 1916.44 refers to vessels afloat, gangways, Jakob's ladders; § 1916.55 refers to radar, radios, masts and king posts.

e.g., whether it is peculiar to shipbuilding or common to other industries as well, whether the construction of a vessel is dependent upon the work at issue, etc.; (b) the proximity in terms of time and location of the work at issue to the work of actually constructing the vessel; and (c) the relationship of the work at issue to the hazards that are normally incident to the construction of a vessel.

In the case now before us, the work being performed by Respondent's pipe shop employees was directly related to Respondent's shipbuilding work only in the sense that approximately 90% of the employees' work product was ultimately installed in the towboats and barges assembled in Respondent's boatyards. Nevertheless, the work being performed by these employees was the fabrication of pipes and pipe assemblies. Therefore, the employees were engaged in what was essentially a manufacturing operation that was not significantly different from operations found in various other industries. Moreover, the workplace of these employees was physically separated from the areas where the towboats and barges were assembled, and the work of the employees was completed before the work of assembling the vessels was begun. For these reasons, the working conditions of the employees, including the hazards incident to their work, were comparable to the working conditions of employees engaged in manufacturing operations and dissimilar to the working conditions customarily encountered by employees engaged in the construction of a vessel.

We therefore conclude, on balance, that the work performed by Respondent's pipe shop employees was not "shipbuilding" or "related employment." We agree with Respondent that the work was not covered by Part 1916 because it was remote in terms of time and location from Respondent's shipbuilding activities and it did not involve exposure to maritime hazards.

We base this conclusion on another ground as well. Having reviewed the standards in former Part 1916, we note that there were no standards therein that specifically applied, either by their express terms or their apparent intent, to the types of working conditions that would be found in Respondent's pipe shop. Indeed, many of the standards, including the one at issue in this case, are expressly

limited to working conditions on vessels or drydocks or in confined spaces such as those typically found in vessels. See note 10, supra. We therefore conclude that the Secretary did not specifically consider the work activities that are before us to be "shipbuilding" or "related employment" when he promulgated 29 C.F.R. Part 1916. Cf. BJ-Hughes, Inc., 82 OSAHRC / , 10 BNA OSHC 1545, 1982 CCH OSHD ¶ 25,977 (No. 76-2165, 1982)(holding that Part 1926 does not apply to oil drilling and concluding, based on review of standards in Part 1926, that the Secretary did not specifically consider oil drilling to be construction work when he promulgated Part 1926).

We reject the Secretary's analogy to the cases interpreting the term "construction work" in 29 C.F.R. § 1910.12, which governs the scope of Part 1926, and his argument in support of an expansive interpretation of the terms "shipbuilding" and "related employment." Initially, we note that, while the "integral part" test in the context of Part 1926 was developed as an interpretation of the term "construction work," extension of that test to former Part 1916 would have resulted in a substitution of the "integral part" test for the test expressly set forth by the Secretary in 29 C.F.R. § 1910.14, including the definitions of "shipbuilding" and "related employment." In sum, we conclude that there is no need for applying an "integral part" test to the clear and unambiguous definitions of "shipbuilding" and "related employment."

We further observe that the Secretary adopted in section 1910.14 the same definitions of "shipbuilding" and "related employment" that he had used under the LHWCA. See note 8 supra. This indicates that the Secretary did not extend former Part 1916 to work activities that had not been covered under the LHWCA standards. There is no evidence of which we are aware that the predecessor standards under the LHWCA ever were applied to the types of activities that are before us. Accordingly, we decline to adopt a test for determining the coverage of former Part 1916 that would lead to an expansion of its coverage to these types of activities.

In addition, we conclude that the Secretary's position is contrary to the purposes and objectives of the Act. It is clear that the goal of safe and healthful working conditions in Respondent's pipe shop would be better served by applying to that shop the general industry standards in 29 C.F.R. Part 1910 rather than the shipbuilding standards formerly in Part 1916. The general industry standards are quite pervasive and they are specifically designed to cover many of the hazards that would be encountered in Respondent's pipe fabrication and assembly operations. In contrast, as indicated above, there are no provisions formerly in Part 1916 that appear to be well suited for application to an operation that is essentially a manufacturing operation separated in both time and location from shipbuilding activities and the hazards incident to those activities.

For the reasons stated above, we affirm Judge Harris' conclusion that the employees in Respondent's pipe shop were not engaged in "shipbuilding" or "related employment." Moreover, because the employees at issue were not engaged in a covered employment, we also affirm the judge's conclusion that 29 C.F.R. Part 1916, including the cited standard, did not apply to the working conditions in Respondent's pipe shop. Accordingly, the judge's decision vacating the citation item alleging noncompliance with 29 C.F.R. § 1916.51(a) on the ground that that standard did not apply to the cited working conditions is affirmed.

SO ORDERED.

FOR THE COMMISSION

Ray H. Darling, Jr.

Ray H. Darling, Jr.
Executive Secretary

Date: MAY 28 1982

DRAVO
14818

COTTINE, Commissioner, concurring:

I join in Part II of the majority's opinion and their conclusion that the scope under the OSH Act of these standards was governed exclusively by the provisions of 29 C.F.R. § 1910.14. Accordingly, the limitation in 29 C.F.R. § 1916.2(d) to employment on "navigable waters . . . including dry docks, graving docks, and marine railways" was a restriction on the scope of Part 1916 only as it applied under the LHWCA and Judge Harris erred in relying upon the provisions of that section. I also concur with the majority's disposition of the alleged violations. However, I would affirm the judge on different grounds.

I

The majority errs in concluding that Respondent's pipe shop employees were not engaged in "shipbuilding" or "related employment." Rather, the Secretary properly relies on analogous Commission precedent construing the term "construction work" in 29 C.F.R. § 1910.12 and correctly concludes that employees are engaged in "shipbuilding" or "related employment" when their work is an integral part of the shipbuilding activities at their worksite. See, e.g., United Telephone Co. of the Carolinas, 76 OSAHRC 110/B14, 4 BNA OSHC 1644, 1976-77 CCH OSHD ¶ 21,043 (No. 4210, 1976); A.A. Will Sand & Gravel Corp., 76 OSAHRC 81/G2, 4 BNA OSHC 1442, 1976-77 CCH OSHD ¶ 20,864 (No. 5139, 1976); Bechtel Power Corp., 76 OSAHRC 38/E2, 4 BNA OSHC 1005, 1975-76 CCH OSHD ¶ 20,503 (No. 5064, 1976), aff'd, 548 F.2d 248 (8th Cir. 1977). In adopting and extending Part 1916 standards, the Secretary applied those standards to "every employment and place of employment of every employee engaged in shipbuilding or a related employment." 29 C.F.R. § 1910.14(a). (Emphasis added). He then defined "related employment" as including "any employment performed as an incident to, or in conjunction with, shipbuilding work . . . ." 29 C.F.R. § 1910.14(b)(2). Accordingly, the coverage of incidental employment was even clearer in the context of Part 1916 than it is in the context of Part 1926, and the principles underlying the Commission's broad construction of the scope of

Part 1926 are of equal, if not greater, force in determining the scope of the standards formerly published in Part 1916. For these reasons, the test urged by the Secretary is the proper test to be applied by the Commission.

Applying this test to the facts of this case, it is clear that Respondent's employees in its pipe shop were engaged in "shipbuilding" or a "related employment." These employees worked on the premises of a large industrial complex where their employer was engaged in shipbuilding as one of its principal activities. Their particular workplace was located only 100 feet from navigable waters and near the marine launching ways. Moreover, the primary purpose of their work was to further Respondent's shipbuilding enterprises. In addition, their work was a necessary step in the integrated process of vessel construction. At the time of the inspection, approximately 90% of the work product of the pipe shop was eventually installed in towboats or barges assembled by Respondent at this worksite. Accordingly, these employees were engaged in work that was an integral part of the shipbuilding activities at Respondent's Neville Island complex and their work activities were within the scope of the OSHA shipbuilding standards formerly published in Part 1916.

II

Notwithstanding the conclusion that Part 1916 was generally applicable to the working conditions in Respondent's pipe shop, I conclude that the particular standard cited in this case did not apply to the cited working conditions. 1/ On this ground, I join the majority in affirming the judge's disposition of the citation at issue.

Section 1916.51(a) included a provision that working and walking areas "on vessels and drydocks" shall be kept clear of materials that could create an obstruction or a tripping or slipping hazard. In light of the limitations of this provision to conditions on "vessels or drydocks," the Commission issued a supple-

---

1/ As set forth in note 1 of the lead opinion, the standard in question was published at 29 C.F.R. § 1916.51(a) at the time the citation on review was issued, but it recently has been renumbered as 29 C.F.R. § 1915.91(a). Throughout this opinion, I use the old codification of the standard.

mental briefing order requesting the views of the parties as to whether section 1916.51(a) in its entirety was limited to conditions on "vessels" and "drydocks." Both the Secretary and Respondent submitted their views on this issue, taking conflicting positions. Nevertheless, the arguments of both these parties share the same underlying premise, that is, that the phrase merely reflected the jurisdicitional limitations of the LHWCA and that it did not have any independent force and effect. This premise is erroneous.

It is more reasonable to conclude that standards using the terms "vessels" and "drydocks" specifically address working conditions or hazards unique to vessels, drydocks, or both vessels and drydocks. In any event, I follow the basic principle that standards should be construed to give effect to all of their provisions so that no part will be rendered superfluous. See In re Surface Mining Regulation Litigation, 627 F.2d 1346, 1362 (D.C. Cir. 1980), citing 2A Sutherland Statutory Construction, § 46.06 at 63 (4th ed. 1973); U.S. v. Menasche, 348 U.S. 528 (1955); Tabor v. Ulloa, 323 F.2d 823 (9th Cir. 1963). In particular, I reject the Secretary's contention that the phrase "on vessels or drydocks" was a limitation on the scope of some of the standards in which it was used but mere surplusage in other standards in which it was used. Section 1910.14(a), the provision that controls the adoption and extension of the LHWCA standards, clearly states that the adopted standards "shall apply according to the provisions thereof." Furthermore, the Secretary's position, if adopted, would require employers to guess as to the meaning of the standards formerly published in Part 1916 and could render particular standards unenforceably vague. Accordingly, I conclude that the phrase "on vessels or drydocks," as used in section 1916.51(a) and other standards formerly published in Part 1916, was a limitation on the scope of those specific provisions.

Although the phrase "on vessels or drydocks" was used only in the third sentence of section 1916.51(a), a reading of the standard as a whole indicates that the entire standard was directed to working conditions and hazards unique to

vessels and drydocks. Accordingly, the cited provision did not apply to the cited conditions in Respondent's pipe shop. For this reason, I concur in the Commission's affirmance of the judge's order vacating this citation item.

Local No. 61

Harris, Judge, OSAHRC

This is a proceeding under Section 10(a) (Section 659 (a)) of the Occupational Safety and Health Act of 1970 which became effective on April 28, 1971 (the Act, 29 U.S.C. 651). The respondent, Dravo Corporation (Dravo), by the Notice of Contest dated August 29, 1975, contests Items 4 and 10 of a citation issued to it on August 13, 1975.[1/]

Item 4 alleged a violation of the standard at 29 CFR 1916.10(a)(2) for that:

> Department of Labor Form Mar-8 designating a competent person had not been filed with the nearest office of the Occupational Safety and Health Administration.

No further reference need be made to this item since the same was vacated on the complainant's motion for the reason that he was satisfied that the form in question had in fact been filed as the standard required (TR. 170-171).

Item 10 alleged a "non-serious" violation of the standard at 29 CFR 1916.51(a) in that:

> Hose and electric conductors were not elevated over or placed under the working surface at the south wall of the pipe shop.

The citation required abatement thereof by August 28, 1975. A Notice of Proposed Penalty issued to Dravo with the said citation proposed a penalty for this violation of $40.

---

1/ The citation, following an inspection had on July 29, 1975, alleged a total of 11 items of alleged violation of specific standards promulgated by the complainant. Item 11 was deleted by an amendment dated August 29, 1975.

The standard at 29 CFR 1916.51(a) provides:

> (a) Good housekeeping conditions shall be maintained at all times. Adequate aisles and passageways shall be maintained in all work areas. All staging platforms, ramps, stairways, walkways, aisles, and passageways on vessels or drydocks shall be kept clear of all tools, materials, and equipment except that which is in use, and all debris such as welding rod tips, bolts, nuts, and similar material. Hose and electric conductors shall be elevated over or placed under the walkway or working surfaces or covered by adequate crossover planks.

At the conclusion of complainant's case, Dravo moved to dismiss the citation on the ground that the employees who worked in the area designated in the citation were not engaged in shipbuilding or a related employment described in 29 CFR 1916.2(d) and were therefore not covered by 29 CFR 1916.51(a), one of the shipbuilding standards. Complainant thereupon moved that the citation be amended to charge, in the alternative, that Dravo, on the same facts, was in violation of the standard at 29 CFR 1910.22(b)(2) (TR. 101-109). Dravo vigorously opposed this application. Each of these applications were then taken under advisement (TR. 101;108). Section 1910.22 is generally applicable to all permanent places of employment and the standard at 29 CFR 1910.22(b)(2) provides:

> (2) Permanent aisles and passageways shall be appropriately marked.[2/]

---

2/ Although complainant's Brief at pp. 8 and 9 refers to 29 CFR 1910.22(b)(2), as Dravo points out (Br. p. 21 fn.), the language referred to by counsel for complainant actually has reference to 29 CFR 1910.22(b)(1) (TR. 104), which provides:

> (b) Aisles and passageways.
>
> (1) Where mechanical handling equipment is used, sufficient safe clearances shall be allowed for aisles, at loading dock , through doorways and wherever turns or passage must be made. Aisles and passageways shall be kept clear and in good repairs, with no obstruction across or in aisles that could create a hazard.

The facts which bear upon a resolution of the issues raised herein are, in the main, not seriously in dispute.

Dravo is a corporation organized under the laws of the State of Pennsylvania and maintains offices in the city of Pittsburgh, in that state. It is a diversified corporation with sales of approximately $500 million a year and operates an extensive steel fabrication and shipbuilding facility on Neville Island, Pennsylvania, where it employs some 2,000 persons (TR. 5-7).

This facility comprises an area of about one-half mile running east and west along Neville Island. There are marine ways on the north side of the island. On the south side, there is a structural shop which produces material handling equipment for mines and steel mills, pelletized disks, tanner gauges, gun carriages for atomic cannons and oxygen furnaces for steel mills. Here also, are fabricated, steel plates which are cut, shaped and formed into parts for towboats (TR. 112-113). Barges and towboats are assembled in their respective boatyards and launched. The construction process to launching, consumes approximately 55 days. Thereafter, the finishing work is done on the vessel. This includes installing the final interior assemblies, insulation, painting and dressing up (TR.114-115).

The pipe shop, the subject of the investigation and citation herein, occupies part of a structure which is approximately 300 feet long by 120 feet wide (TR. 43) and is located on the main channel side of the Island, near the launching ways (TR. 74). The pipe shop fabricates

sub-assemblies, including rudders, Kort nozzles, sewage holding tanks and fittings for installation in barges and towboats under construction in the boatyards and on the ways. These sub-assemblies are sent to the structual shop for inclusion in other assemblies under construction and then shipped to the boatyards (TR. 111; 113). In the pipe shop also are fabricated, pipe assemblies for eventual installation in the barges and towboats being built in the boatyards (TR. 25; 53; 54; 62; 71; 73). When these assemblies are completed they are loaded into trucks and taken to either the structual shop or directly to a storage area in the boatyard or directly to the ways for installation in a barge or towboat (TR. 64; 71; 75; 116-117). Approximately 90 percent of the pipe shop's production goes into vessels in the assembly area in the boatyards. The remaining 10 percent concerns material handling machinery and maintenance (TR. 63; 117; 140; 166).

The pipe shop employs about 25 men, of these 12 or 13 are welders. The rest are fitters, machinist, and pipe benders. Their work is done on worktables set up in the area occupied by the pipe shop. There is no evidence, nor is it contended, that any of these men were at any time engaged in installing any of their fabrications in a barge or towboat or that they participated in moving any of these fabrications from the pipe shop or a final storage area to or into any vessel in any stage of construction (TR. 58; 61; 62-63; 118; 146; 149; 158; 160-161).

I am constrained, upon these facts, to find that the standard at 29 CFR 1916.51(a) is not applicable to the pipe shop, as it is herein described, for the following reasons. The standard at 29 CFR 1916.51(a) was originally promulgated by the Secretary of Labor as 29 CFR 1502. 51 (a)

on March 27, 1964, pursuant to the Longshoremen's and Harbor Workers' Compensation Act (P. Law No. 85-792, 29 U.S.C. 941 et seq.).[3/] Standards under Part 1502 of Title 29 entitled "Safety and Health Regulations for Shipbuilding," were deemed to be occupational safety and health standards on December 29, 1970, by force of Section 653(b)(2) of the Act and became enforceable against employers by virtue of Section 654(a)(2). On October 18, 1972, the Secretary of Labor, the complainant herein, adopted the standards prescribed in Part 1502 "under section 6(a) of the Act" (Section 655(a)) and on October 19, 1972, these standards were re-designated as Part 1916 of Title 29 (29 CFR 1910.14, 37 F.R. 22104 and 29 CFR 1916, 37 F.R. 22485). The Standard at 29 CFR 1502.51(a) is presently designated as 29 CFR 1916.51(a), and is the standard under which the citation herein has been issued. That the complainant intended that the standards in Part 1916 have the same meaning, extent and application as they had as Part 1502, is, it seems to me, clear.

The purpose, scope and responsibility prescribed in Section 1502.1 is identical with that in Section 1916.1 and both sections state that "The purpose of this part is to make determinations under this standard with respect to shipbuilding activity."

Reference to 29 CFR 1910.14(a) establishes that "The standards prescribed by Part 1502 of this title and in effect on April 28, 1971...

---

3/ The sub-section was amended on October 10, 1967, (32 F.R. 14049) and, as amended, is identical in language with 29 CFR 1916.51(a)

shall apply, according to the provisions thereof, to every employment and place of employment of every employee engaged in shipbuilding or a related employment." (Emphasis added). Section (b) defines "shipbuilding" and "related employment" as

> (1) 'Shipbuilding' means the construction of a vessel, including the installation of machinery and equipment; and
>
> (2) 'Related employment' means any employment performed as an incident to, or in conjunction with, shipbuilding work, including, but not restricted to, inspection, testing trials, and employment as a watchman;

29 CFR 1916.2(i) and (j), define the same terms in identical language.[4/]

It is conceded that Dravo is an employer as defined in Section 1916.2 (c) (identical in language with Section 1502.2 (c)) (TR. 96). However, it is the definition of "employee" as it appears in Section 1502.2(d), now 1916.2(d), which controls the requirement in 1916.1(a), that every employer "furnish and maintain employment and places of employment which are reasonably safe for his employees in all employments covered thereby....[5/] (Emphasis added). "Employee" is defined as

> ...any person employed in shipbuilding or related employments on the navigable waters of the United States, including dry docks, graving docks and marine railways, by an employer as defined in paragraph (e) of this section. (Emphasis added).

4/ Taken word for word from 29 CFR 1502.2(i) and (j). Unlike 1904.14(b)(2) "employment" in line 2 thereof, appears in plural form in both 1502.2(i) and 1916.2(j).

5/ Section 41 of the Longshoremen's and Harbor Workers' Compensation Act, supra.

No change has been made in the standards in Part 1916 since their adoption by the Congress as occupational safety and health standards by virtue of Section 4(b)(2) of the Act and it seems clear beyond a doubt that the Secretary of Labor is in accord with the expression in Section 1916.1(a), formerly Section 1502.1(a), that the purpose of these standards is to make determinations "with respect to shipbuilding."

Applying the circumstances of this case, it is clear that Dravo's employees working in the pipe shop were not engaged in the construction of any vessel nor the installation therein of machinery and equipment.

Quaere. Were they engaged in any "related employments on the navigable waters of the United States, including dry docks, graving docks and marine railways"?

No evidence appears to indicate that any of these said employees were working in or on any dry dock, graving dock or marine railway. That being so, was their employment such as is covered by the Longshoremen's and Harbor Workers' Compensation Act?

Section 903(a) of the Longshoremen's and Harbor Workers' Compensation Act, as amended in 1972 (33 U.S.C. 903(a)), provides:

> Compensation shall be payable...only if the disability or death results from an injury occurring upon the navigable waters of the United States (<u>including any adjoining pier, wharf, dry dock, terminal, building way, marine railway, or other adjoining area customarily used by an employer in loading, unloading, repairing, or building a vessel</u>)... (Emphasis shows the 1972 amendments.)

Section 902(3) of the same Act defines employee as follows:

> The term 'employee' means any person engaged in maritime employment, including any longshoremen or other person engaged in longshoring operations, and any harbor worker including a ship repairman, shipbuilder, and shipbreaker, .... (Emphasis shows the 1972 amendments.)

Prior to the 1972 amendments, the injury, in order to be covered under the law, had to occur "upon the navigable waters of the United States..." and coverage stopped at the waters edge. The 1972 amendments established a dual test for coverage. The definition of "navigable waters" was expanded to include specified land areas and the employee must have been engaged in "maritime employment." See, ITO Corporation of Baltimore, et al v. Benefits Review Board, U. S. Department of Labor, et al, (4 Cir., December 22, 1975, Nos. 75-1051; 75-1075; 75-1196). As that court said, "The net effect of the 1972 Amendments was therefore to broaden the area in which an injury would be covered, and narrow the class of persons eligible according to job function." The term "maritime employment", as the same court said, "is a phrase that embodies the concept of a direct relation to a vessel's navigation and commerce." For a definition of the term "maritime employment" the House and Senate Reports concerning "Extension of Coverage to Shoreside Areas." are informative.6/ The House Report contains the following:

> The present Act, insofar as longshoremen and and shipbuilders and repairmen are concerned, covers only injuries which occur "upon the navigable waters of the United States." Thus, coverage of the present Act stops at the water's edge;...
>
> * * *

6/ S. Rep. No. 92-1125, 92 Cong. 2d Sess. (1972); H.R. Rep. No. 92-1441, 92d Cong. 2d Sess. (1972).

> ...the bill would amend the Act to provide coverage of longshoremen, harbor workers, ship repairmen, ship builders, shipmakers, and other employees engaged in maritime employment...if the injury occurred either upon the navigable waters of the United States or any adjoining pier, wharf, dry dock, terminal, building way, marine railway, or other area adjoining such navigable waters customarily used by an employer in loading, unloading, repairing, or building a vessel.
>
> *  *  *
>
> ...The Committee does not intend to cover employees who are not engaged in loading, unloading, repairing, or building a vessel, just because they are injured in an area adjoining navigable waters used for such activity. (Emphasis added).

It seems clear that for the purposes of Section 1916.1, the "employments" covered by the Longshoremen's Act, as amended, are limited to those actually engaged in shipbuilding, either on navigable waters or on an adjoining pier, wharf, dry dock, terminal, building way, marine railway or on an adjoining area customarily used by the employer in repairing or building a vessel. The reference to "related employments" in Section 1916.2(d) can only be taken to mean those persons who are actually engaged in support employments such as checking, storing materials and moving materials from final storage points, in an area adjoining navigable waters and customarily used by the employer in the building of a vessel, to or into the vessel. Paraphrasing the language of the 4th Circuit Court in ITO Corporation of Baltimore, supra, I reject the conclusion that all persons, excluding clerical employees other than checkers, who play any part in the overall shipbuilding process are covered by the Act, as amended. I think that, with respect to shipbuilders or other persons engaged in shipbuilding operations, the Amendments

extend only to those employees engaged in shipbuilding and related activities between the ship and the last point of rest of equipment and machinery delivered to the shipbuilding area intended for installation in the ship under construction, including checkers directly involved in such shipbuilding or related functions. (Slip op. p. 24).

I do not believe that the fact that 90 percent of the fabrications formed in the pipe shop eventually are installed in a vessel being built in Dravo's marine yards (TR. 117) alters the fact that the employees in the pipe shop are not engaged in shipbuilding or the type of "related employment" contemplated by the Longshoremen's Act, as amended. I therefore find, for the reasons expressed, that the specific standard at 29 CFR 1916.51(a) is not applicable to the area of and the activities carried on in the pipe shop.

At the conclusion of Dravo's motion to vacate the citation on the ground that the shipbuilding standard at 29 CFR 1916.51(a) is not applicable to the pipe shop, the complainant moved that an alternative allegation that Dravo was in violation of the general standard at 29 CFR 1910.22(b)(2), be added to the citation. Dravo resisted this application, refused the court's offer of a continuance to prepare against the charge in the alternative and elected to proceed (TR. 107-108). There is ample authority for the allowance of the amendment of pleadings under Rule 15(b) of the Federal Rules of Civil Procedure where no undue prejudice will result and the new issue has been tried by express or implied consent; Secretary v. Isaacson Structural Steel Company, 17 OSAHRC 496 (1975); Secretary v. Park Construction Company, 17 OSAHRC 343 (1975);

Secretary v. Brisk Waterproofing Co., Inc., 3 OSAHRC 1132 (1973).

Complainant's motion came at the conclusion of his presentation. Dravo had not yet begun to present its defense and counsel, satisfied that "the facts remain the same in either case." and that "I don't think we need time to present the case," elected to put in his defense to both allegations (TR. 107-108). I can therefore perceive no prejudice flowing to Dravo and am satisfied that it chose to proceed fully aware that if the facts warranted, liability might be predicated upon a violation of the standard at 29 CFR 1910.22(b)(2). I therefore grant complainant's motion to amend. It follows that, since I have determined that the particular standard at 29 CFR 1916.51(a) does not apply to Dravo's pipe shop, the general standard at 29 CFR 1910.22(b)(2) becomes applicable under 29 CFR 1910.5(c)(2).[7/]

Section 1910.22(b)(2) requires that "permanent aisles shall be appropriately marked." I find no testimony that any existing permanent aisles in the pipe shop were not appropriately marked. On the contrary, Reed, the inspecting officer, stated that there were designated walkways

7/ This standard provides:

> (2) On the other hand, any standard shall apply according to its terms to any employment and place of employment in any industry, even though particular standards are also prescribed for the industry, as in subpart B or Subpart R of this part, to the extent that none of such particular standards applies. To illustrate, the general standard regarding noise exposure in § 1910.95 applied to employments and places of employment in pulp, paper, and paperboard mills covered in § 1910.261.

See, Warnel Corporation, Docket No. 4537 (March 31, 1976).

in the pipe shop and that he did not cite Dravo for improperly marked or cluttered or obstructed walkways (TR. 29; 133-134). There is some testimony that it is necessary to cross hose and weld lines, which are in the work area, in order to get to a designated walkway (TR. 139; 159; 160; 191; Exhs. C-1; R-1; R-2). However, the designated walkways are kept clear (TR. 42-43; 45; 69; 121) and where hose and lines cross walkways, they are covered by metal treadles (TR. 122). I find therefore, for the foregoing reasons, that Dravo was not in violation of Section 1910.22(b)(2) and that Item No. 10 of the Citation herein, as amended, should be vacated in all respects.

So Ordered.

| v. | : | OSHRC Docket No. 77-893 |
| AMERICAN LUGGAGE WORKS, INC., | : | |
| Respondent, | : | |
| | : | |

DECISION

Before: ROWLAND, Chairman; CLEARY and COTTINE, Commissioners.

BY THE COMMISSION:

A decision of Administrative Law Judge Ben D. Worcester is before the Commission pursuant to section 12(j), 29 U.S.C. § 661(i), of the Occupational Safety and Health Act of 1970, 29 U.S.C. §§ 651-678 ("the Act"). Judge Worcester vacated a citation alleging noncompliance with 29 C.F.R. § 1910.212(a)(3)(ii).[1/] The citation alleged that Respondent, American Luggage Works, Inc., failed to guard the points of operation of twenty-five Thomson rivet machines. For the following reasons, we reverse Judge Worcester's decision and affirm the citation.

---

1/ 29 C.F.R. § 1910.212(a)(3)(ii) provides:

§ 1910.212 General requirements for all machines.

(a) Machine guarding—

* * *

(3) Point of operation guarding.

* * *

(continued on next page)

I

Respondent manufactures soft vinyl suitcases sold under the American Tourister brand name at its plant in Woonsocket, Rhode Island. The suitcases range in height from twenty-two to twenty-nine inches and are manufactured by joining together vinyl sheets, vinyl straps, rubber and cardboard. The pieces are fastened together by rivets driven by twenty-five Thomson rivet machines, which are a specialized form of power press. The machines are used for four operations: connecting frames to the floor of the luggage and then attaching the frame and floor assembly to the case, attaching handles to the suitcase, attaching bumpers or feet to the luggage, and attaching buckles to shoulder straps which are then attached to the bags.

The rivet machine is operated by depressing a foot pedal, which is shrouded to prevent accidental operation. The foot pedal engages a clutch which engages a power supply from an electric motor. The power is transmitted to a plunger contained within a frame. Directly below the plunger is a pocket holding the rivet. The pocket is about one-half to three-quarters of an inch above the pilot, a pin is used to locate and align work upon the anvil. This pin is about one-eighth of an inch in diameter. The parts to be riveted are assembled over this spring-loaded pilot. When the press is tripped by depressing the foot pedal, the plunger pushes the rivet through the pocket and through the spring-loaded pilot. The pilot retracts downward

---

1/ (continued)

(ii) The point of operation of machines whose operation exposes an employee to injury, shall be guarded. The guarding device shall be in conformity with any appropriate standards therefor, or, in the absence of applicable specific standards, shall be so designed and constructed as to prevent the operator from having any part of his body in the danger zone during the operating cycle.

part way, allowing the hollow tubular rivet to be pushed downward through the pilot and through the material to be joined. The rivet expands and sets in place as it strikes the anvil. Washers are used with the rivets to strengthen the attachment of the frame to the floor of the luggage and of the bumpers or feet to the luggage. The operator places the washers on the pilot. After placing the washer, an operator removes his hand from the point of operation to hold the bag steady during the operating cycle.

At the hearing, the Secretary presented as witnesses the inspecting compliance officer, Guido DiCenso, and his supervisor, John Barnes. Mr. Barnes inspected Respondent's workplace after the citation issued. Mr. Barnes testified that the most generally accepted guard for rivet machines is the ring guard. The ring guard consists of an aluminum tube or wire ring, one-eighth of an inch in diameter, around the riveting machine plunger. The ring must drop toward the anvil a predetermined distance, which can be adjusted depending on the thickness of the material being riveted, before the machine can operate. When the ring drops down the predetermined distance without encountering an obstruction, a circuit is closed allowing the machine to cycle. If the operator has part of his body in the point of operation, the ring guard will not drop the predetermined distance, and the machine will not cycle. A brochure explaining the operation of the Touch-O-Matic ring guard device manufactured by the Positive Safety Manufacturing Company indicates that the Touch-O-Matic ring guard can be attached to either a side or the front of the machine by means of three mounting holes. Once attached, only one set screw has to be adjusted to alter the distance the ring guard would be required to drop. Mr. Barnes stated that were an employee to move the guard upwards from its pre-adjusted guarding position and then step on the foot pedal to activate the rivet press the press would not operate.

Mr. DiCenso testified that he observed employees' hands between one and eighteen inches from the point of operation when the machine was activated for different riveting operations. For example, while an employee was attaching handles to a piece of luggage, the compliance officer observed the employee's hands within one inch of the point of operation as the machine cycled. Moreover, while aligning feet on the bottom of the luggage prior to activating the rivet machine, the operator placed his hands directly on the point of operation. The operator removed his fingers from the point of operation before stepping on the foot pedal to activate the machine.

The Secretary also presented as a witness Frances Boni, an employee who operated a rivet machine to rivet a strap and buckle onto the luggage. She stated that her hand was one-half to one inch from the point of operation when the rivet struck the strap and attached it to the luggage bag. She stated that, while she was never injured, she had close calls when her hands slipped while holding the strap over the pin on the anvil.

The Secretary also presented as a witness another employee, Mary Beattie, who riveted the buckle on the zipper which holds the shoulder strap. Mrs. Beattie stated that she had to place a washer right on the pilot at the point of operation prior to removing her hands from the point of operation. When she stepped on the foot pedal, her hands were about two or three inches from the point of operation. She was injured when she accidentally cycled the machine while her hands were still within the point of operation. A rivet and washer went through her thumb and she was out of work for three weeks. However, she thought she had been careless in allowing herself to be injured. The Secretary showed that

five employees had been injured over a three-year period while operating the rivet machines.

Respondent presented three witnesses at the hearing. Henry Stevens, Respondent's director of safety and security, stated that a ring guard was not necessary to protect employees in riveting the frame to the luggage bag and the frame to the floor of the bag since the operator was required to hold the outside of the bag. The operator's hands were therefore away from the point of operation. Moreover, when bumpers were riveted to the bottom of the luggage, there was not sufficient clearance for fingers to get within the point of operation. However, he also stated that this was not true of the three other riveting processes: riveting the frame to the floor, the frame to the bag, and the handle to the bag.

Mr. Stevens stated that he had not attempted to guard the point of operation of the rivet machines before the citation issued in this case. He stated that the ring guard would be appropriate if it closed to within one-quarter of an inch of the point of operation but that the work pieces were of such a configuration that a guard could leave at least half an inch, and possibly a greater opening, at the point of operation. He also testified that, in attaching handle tabs to the covering over the frame of the suitcase, the ring guard would allow the machine to operate while the guard was still an inch and a quarter above the top of the bag.

Respondent's second witness was Marcel Hoyas, a senior loss prevention consultant employed by Liberty Mutual Insurance Company, the company which carries Respondent's workman's compensation policy. He stated

that rivet machines in the luggage manufacturing industry did not have point of operation guards. Mr. Hoyas was familiar with the ring guard protective device but concluded that "the work place configuration" did not lend itself to using the ring guard. He stated that the ring guard could not protect employees riveting the handle to luggage because the handle extended too high above the luggage bag. As a general matter, he concluded that ring guards would not adequately protect employees operating rivet machines because the operator could still reach over, around, or through the guard. He also stated that the ring guard would not protect employees to a greater degree than current operating procedures because the employee would rely on the ring guard rather than adhere to proper work practices. He thought that the ring guard was highly susceptible to malfunction; he had tested ring guards and "in three successive attempts [he] found them to malfunction."

Respondent's last witness was John W. Juechter, a design and mechanical engineer. Mr. Juechter stated that the point of operation of Respondent's rivet machines could not be "effectively guarded" by any guarding device and that for all of Respondent's operations, except one, a ring guard would be "impractical." The only operation in which Mr. Juechter thought a ring guard could be used was attaching bumpers to the bottom of the bag. However, since the operator's hands did not come near the anvil during this operation, he saw no advantage in using a guard for this operation. Because the materials riveted together are not uniform in shape, quality or thickness, and since many pieces are large and supported on a single point, Mr. Juechter stated that it would be impractical to use a ring guard — a device that must be adjusted to drop a predetermined distance.

Mr. Juechter stated he does not design safety guards and did not observe, in preparation for this case, any guards on riveting machines for luggage manufacturing. He has seen the Touch-O-Matic ring guard device for point of operation guarding at a plant of a different employer in Rhode Island. There, the rivet presses were riveting small pieces together. He had never seen a Touch-O-Matic ring guard used on a riveting machine in a luggage operation and thought that there was no serious opportunity for injury where the operator's hands were an inch or two away from the point of operation.

II

Judge Worcester vacated the citation because he concluded that the Secretary had not established how Respondent should have guarded its rivet machines. He found that the Secretary had not established that using a ring guard was feasible. Relying on Respondent's witnesses Mr. Hoyas and Mr. Juechter, he further found that no attentive employee could be injured and that a ring guard would preclude performance of required work.

The Secretary petitioned for review of Judge Worcester's decision and excepted to Judge Worcester's findings that employees attentive to their duties could not be injured, that a ring guard was not reliable and would preclude performance of required work, and that no other type of guard would be feasible. The Secretary also took exception to the judge's placing the burden of proof on the Secretary to show what the employer should have done to comply with section 1910.212(a)(3)(ii). Commissioner Cleary granted the petition and directed review on all issues raised in the petition.

On review, the Secretary argues that the distance of the operator's hands to the point of operation was conceded to be as little as one inch,

establishing exposure to the hazard, and that section 1910.212(a)(3)(ii) requires guarding by a device and does not permit reliance on employee attentiveness. He argues that the employer must establish the affirmative defense of impossibility, not infeasibility, and that the Secretary need not prove feasibility. He further argues that to establish the impossibility defense, the employer must establish that compliance was impossible and that available alternative protective means were used. The Secretary contends that Respondent provided no alternative protection except for legally insufficient safety instructions and made no effort to devise appropriate machine guarding.

The Secretary argues that Respondent failed to establish that it was impossible to guard the riveting machines. He notes that Respondent never hired a qualified consultant to assist in guarding the machines, did not test any guards, and did not apply for a variance. He points out that Respondent's safety director, Mr. Stevens, was not an engineer, never designed point of operation guards for rivet machines, and never tried to use any guards on these machines. He also notes that Respondent's witness Mr. Hoyas, the insurance company employee, was not a mechanical engineer, never designed guards for riveting machines, and stated he was not qualified to design such guards. The Secretary also states that Mr. Hoyas, despite Respondent's injury record, did not consult with anyone to see if a ring guard could be adapted. Moreover, the Secretary points out that Mr. Hoyas did not know what guarding methods had been tried in the industry. Finally, concerning Respondent's witness Mr. Juechter, a mechanical engineer, the Secretary notes that, while the witness concluded that the point of operation could not be guarded, Mr. Juechter had not observed any guarding in preparation for this case, had not run any guarding tests himself, and

had not consulted with any engineers regarding Respondent's machines. The Secretary concludes that, absent even the most basic attempts to test methods of guarding rivet machines, Respondent cannot sustain an affirmative defense of impossibility.

Respondent argues on review that the mere presence of an operator's hands in close proximity to an unguarded machine does not, by itself, show employee exposure to injury. Respondent asserts that, because the foot pedals activating the rivet machines were shrouded and the machines could not cycle more than once when the pedals were depressed, the employees were protected from point of operation hazards. Respondent also emphasizes that employees received instructions on how to operate the machines and, because they were required to hold the materials being riveted while the machines cycled, the employees' hands were inevitably located away from the point of operation. Respondent asserts that, in view of these safety measures, the judge properly found that employees were not exposed to injury.

Respondent further argues that it has proved an impossibility of compliance defense. It points to testimony that (1) ring guards had been tested and had been found to be highly susceptible to malfunctioning, and (2) the different sized pieces of luggage being riveted made installation of the ring guard impossible. Respondent states that its witnesses Mr. Hoyas and Mr. Juechter considered guarding and determined it to be inappropriate. Respondent contends that the Secretary only introduced evidence of the feasibility of installing a ring guard and that Respondent refuted this evidence, showing that no form of ring guard could be installed. Respondent then argues that once it introduces substantial evidence that one method of guarding is impossible, the Secretary must either rebut that evidence or show that some other guarding device is

possible. Finally, Respondent contends that it had instituted alternative protective measures consisting of instructions to employees concerning proper operating procedures in view of the configuration, size, and arrangement of the materials being riveted.[2/]

III

In Buckeye Industries, Inc., 75 OSAHRC 21/B3, 3 BNA OSHC 1837, 1975-76 CCH OSHD ¶ 20,239 (No. 8454, 1975), aff'd, 587 F.2d 231 (5th Cir. 1979), the Commission stated that section 1910.212(a)(3)(ii) prescribes the performance required in guarding the point of operation of machines, that the Secretary need not show that it is possible for guards to be used on machines, and that the impossibility of guarding the point of operation is an affirmative defense that the employer must establish. See also F.H. Lawson Co., 80 OSAHRC 19/A14, 8 BNA OSHC 1063, 1980 CCH OSHD ¶ 24,277 (No. 12883, 1980), appeal dismissed, No. 80-3277 (6th Cir. Feb. 9, 1981). Accordingly, Judge Worcester erred in vacating the citation on the ground that the Secretary failed to establish that there was a feasible method to guard the point of operation.

To establish noncompliance with section 1910.212(a)(3)(ii), the Secretary must show that the point of operation of the machine exposed employees to injury and that it was not physically guarded. Hughes Brothers, Inc., 78 OSAHRC 65/A2, 6 BNA OSHC 1830, 1978 CCH OSHD ¶ 22,909 (No. 12523, 1978); Buckeye Industries, Inc., supra. The record in this case reveals that, during the operating cycle, the operators' hands were as close as one

---

2/ Respondent also argues that section 1910.217 exempts rivet machines from the guarding requirements of section 1910.212. We have rejected this argument, Irvington Moore, 75 OSAHRC 45/A2, 3 BNA OSHC 1018, 1974-75 CCH OSHD ¶ 19,523 (No. 3116, 1975), aff'd, 556 F.2d 431 (9th Cir. 1977).

inch to the unguarded point of operation. This is sufficient to show that employees were exposed to injury. See F.H. Lawson Co., supra.

Respondent's argument that its employees were not exposed to point of operation hazards because they were instructed in safe operating procedures and were required to remove their hands from the point of operation during the operating cycle lacks merit. We have previously stated, in Hughes Brothers, Inc., supra, that section 1910.212(a)(3)(ii) requires that guarding be provided by a "device" and does not allow reliance upon the skill or attentiveness of employees. See also Pass & Seymour, Inc., 79 OSAHRC 101/C13, 7 BNA OSHC 1961, 1979 CCH OSHD ¶ 24,074 (No. 76-4520, 1979), appeal dismissed, No. 80-4013 (2nd Cir. Mar. 19, 1980); Slyter Chair, Inc., 76 OSAHRC 46/A2, 4 BNA OSHC 1110, 1976-77 CCH OSHD ¶ 20,589 (No. 1263, 1976); Irvington Moore, 75 OSAHRC 45/A2, 3 BNA OSHC 1018, 1974-75 CCH OSHD ¶ 19,523 (No. 3116, 1975), aff'd, 556 F.2d 431 (9th Cir. 1977). The standard is intended to eliminate danger from unsafe operating procedures, poor training, or employee inadvertence. Pass & Seymour, Inc., supra; Signode Corp., 76 OSAHRC 43/A2, 4 BNA OSHC 1078, 1975-76 CCH OSHD ¶ 20,575 (No. 3527, 1976), appeal denied, 549 F.2d 804 (7th Cir. 1977). In this case, five employees have been injured operating Respondent's rivet machines over a three-year period.

Moreover, the evidence shows that employees' hands were close to the point of operation during the operating cycle. Respondent's reliance on shrouded foot pedals and the machines' non-repeating feature as a method of guarding is misplaced, for these only assist the employees to prevent inadvertent cycling and do not prevent inadvertent contact with the point of operation while the machines are cycling. Thus, the shrouded foot pedals and the non-repeating feature of the machines do not constitute guarding

that prevents employees from having their hands in the point of operation during the operating cycle. See MRS Printing, Inc., 78 OSAHRC 84/B10, 6 BNA OSHC 2025, 1978 CCH OSHD ¶ 23,102 (No. 76-3113, 1978). Accordingly, we conclude that the Secretary has established that Respondent's employees were exposed to the hazard of an unguarded point of operation.[3/]

We further conclude that Respondent failed to establish its defense of impossibility. To establish the defense, the employer must establish either that compliance with the standard would preclude performance of the required work or that compliance would be functionally impossible. The employer must also show that alternative means of protection were unavailable. Pass & Seymour, Inc., supra; M.J. Lee Construction Co., 79 OSAHRC 12/A2, 7 BNA OSHC 1140, 1979 CCH OSHD ¶ 23,330 (No. 15094, 1979). In this case, Respondent has not met this burden.

---

3/ Respondent argues that American National Standards Institute ("ANSI") B154.1-1974 is an "appropriate" standard to which an employer may refer, for guidance in guarding, by the terms of § 1910.212(a)(3)(ii), see note 1 supra, and that, because the ANSI standards except rivet machines used to manufacture suitcases from guarding, Respondent was not required to guard its rivet machines. We have recently held, in George C. Christopher & Son, Inc., No. 76-647 (Feb. 26, 1982), that the phrase "any appropriate standards therefor" within section 1910.212(a)(3)(ii) refers only to applicable specific standards published or incorporated by reference as occupational safety and health standards in Title 29 of the Code of Federal Regulations. Since ANSI B154.1-1974 is not a specific standard published or incorporated by reference as an occupational safety and health standard in Title 29 of the Code of Federal Regulations, we reject Respondent's argument. Moreover, ANSI B154.1-1974 requires that the point of operation of rivet setting machines be guarded unless, among other things, the shape or nature of the materials being riveted would preclude guarding. The riveting of suitcases is listed as one example where the method of riveting might preclude guarding the point of operation. As our discussion of Respondent's impossibility defense indicates, Respondent has not shown that its riveting methods fit within the exception to the standard's guarding requirements, and thus has not shown that the ANSI standard, even if applicable, would not require guarding of the point of operation of its rivet setting machines.

The testimony of Mr. Stevens and Mr. Hoyas that the ring guard would leave a large enough opening to permit employees' hands to enter the point of operation while they riveted handles onto the luggage bags was limited to that operation and did not address the impossibility of installing the guard for use in other operations. The testimony of all three of Respondent's witnesses about the problems engendered by the configuration of the materials being riveted is also insufficient to establish the defense. The testimony did not factually describe why a particular riveting operation could not be performed if a ring guard were used to protect employees from contact with the machine at the point of operation. The witnesses' testimony was general and, in essence, conclusory. The witnesses only indicated that, because of the varying shapes, quality, thicknesses, sizes, and ways of holding the materials into the point of operation, use of the ring guard would be, in Mr. Juechter's words, "impractical" and would leave the point of operation "ineffectively guarded." At most, the testimony suggests that the guard would have to be adjusted for different operations and for materials of different sizes and shapes. See F.H. Lawson Co., supra; Hughes Brothers, Inc., supra. However, the Secretary offered unrebutted testimony that the Touch-O-Matic ring guards could easily be adjusted to accommodate different sized pieces riveted together by adjusting one set screw.[4/]

---

4/ Even if we were to agree with the Respondent's assertion that during certain riveting operations the point of operation would be ineffectively guarded, the Respondent is not excused from its obligation to provide whatever protection is possible. As we have previously noted:

> To accept Respondent's argument would be, in effect, to allow a total absence of protection because the guard does not provide complete protection. This is contrary to the express purpose of the Act. See

(continued on next page)

Mr. Hoyas testified that he had tested the ring guard, and "in three successive attempts" found that it failed. However, he did not indicate when he made these tests, how they were made, or that he made any attempts to adjust the guards for use on Respondent's machines. Neither Mr. Juechter nor Mr. Stevens testified that they had attempted to design guards for the machines and Mr. Stevens conceded that he had not tried to guard the machines prior to the inspection. What the Commission stated in F.H. Lawson Co., supra, is equally applicable here:

> The flaw in respondent's proof of impossibility lies in its failure to even consider changes in its mode of production that might lead to compliance.
>
> * * *
>
> Thus, a respondent faced with a guarding problem is expected to use the skills and resources at its disposal to develop an acceptable method of guarding. This may, in some cases, require changes in the method of operation of the machine.
>
> * * *
>
> [T]he use of certain guarding techniques may make the operation of respondent's machines difficult. Respondent, however, made no attempt to find an appropriate combination of guarding techniques and operating procedures in order to protect its employees. Therefore, Respondent's defense of impossibility must fail.

8 BNA OSHC at 1067, 1980 CCH OSHD at p. 29,575.

Moreover, a test of the guard would be relatively simple in this case because the guard is available and adjustable. Accordingly, absent

4/ (continued)

Sec. 2(b) of the Act; Kelly Construction Services, Inc., 76 OSAHRC 89/F3, 4 BNA OSHC 1491, 1976-77 CCH OSHD ¶ 20,925 (No. 7102, 1976).

Boonville Division of Ethan Allen, Inc., 78 OSAHRC 105/B4, 6 BNA OSHC 2169, 2172, 1979 CCH OSHD ¶ 23,219 at p. 28,078-9 (No. 76-2419, 1978).

evidence of an attempt to use the guard in each of the four operations, we do not accept Respondent's impossibility defense. We do not uphold the defense as to the handles riveting operation, despite Respondent's testimony, because Respondent has not tested to confirm its conclusion and, in this operation, an operator's hands are one inch from the point of operation. If Respondent, after installing the ring guard, does find that the guard precludes performance of any of its work, Respondent may file a petition for modification of the abatement requirement. See section 10(c) of the Act, 29 U.S.C. § 659(c).

IV

The Secretary proposed a $60 penalty for the violation, which he alleged was nonserious.[5/] At the hearing, Respondent stated that if a violation was found, Respondent did not contest the proposed penalty. Having considered the factors in section 17(j) of the Act, 29 U.S.C. § 666(i), we assess a penalty of $60.

Accordingly, the judge's decision is reversed and the citation is affirmed. A penalty of $60 is assessed. SO ORDERED.

FOR THE COMMISSION

Ray H. Darling, Jr.

RAY H. DARLING, JR.
EXECUTIVE SECRETARY

DATED: MAY 28 1982

---

5/ Respondent also suggests, in its argument in its review brief, that the possibility of injury is negligible in this case and that therefore the violation should be characterized as de minimis. However, we affirm the violation as nonserious because the possibility of injury evidenced by the record in this case and the nature of the harm that could result from an accident are not negligible. See Pratt & Whitney Aircraft, 81 OSAHRC 39/A2, 9 BNA OSHC 1653, 1981 CCH OSHD ¶ 25,329 (No. 13401, 1981), appeal withdrawn, No. 81-4104 (2nd Cir. Aug. 3, 1981); General Motors Corp., Rochester Products Division, 81 OSAHRC 30/E13, 9 BNA OSHC 1575, 1981 CCH OSHD ¶ 25,279 (No. 78-2894, 1981), and cases cited therein.

ROWLAND, Chairman, dissenting:

This case represents the fourth time that riveting machines in facilities owned by Respondent have been inspected. At each previous inspection, the compliance officers found no violation of point of operation guarding standards on the basis of the exemption set forth in 29 C.F.R. § 1910.217(a)(5).[1/] I believe that the compliance officers were correct the first three times, and that section 1910.217(a)(5) precludes the Secretary from citing Respondent under the general point of operation guarding standard at section 1910.212(a)(3)(ii). However, even assuming that the cited standard applies, I believe the record establishes, for all the rivet machines, either that employees' hands were sufficiently far away and protected from the point of operation when the machines cycled that employees were not exposed to injury when following proper operating procedures, or that it would be infeasible to guard the machines.

It is undisputed that Respondent's riveting machines are mechanical power presses. Section 1910.217 is entitled "Mechanical power presses" and contains detailed requirements such machines must follow, including requirements for guarding the point of operation. See section 1910.217(c). An employer in Respondent's position would therefore naturally look to section 1910.217 to determine the requirements for guarding its rivet machines. See Snyder Well Servicing, Inc., 82 OSAHRC , 10 BNA OSHC 1371, 1375, 1982

---

1/ 29 C.F.R. § 1910.217(a)(5) provides, in pertinent part:

§ 1910.217 Mechanical power presses.

(a) General requirements.

* * *

(5) Excluded machines. Press brakes . . . riveting machines and similar types of fastener applicators are excluded from the requirements of this section.

CCH OSHD ¶ 25,943 at p. 32,511 (No. 77-1334, 1982); General Supply Co., 77 OSAHRC 16/A2, 4 BNA OSHC 2039, 1976-77 CCH OSHD ¶ 21,503 (No. 11752, 1977), appeal dismissed, No. 77-1614 (5th Cir. June 22, 1977). When it did so, it would discover that section 1910.217(a)(5) excludes riveting machines "from the requirements of [section 1910.217]." This indicates to employers that point of operation guarding of such machines is not required. Nothing in the standards gives employers fair warning that they are subject to point of operation guarding requirements under other standards. See Irvington Moore v. OSHRC, 556 F.2d 431 (9th Cir. 1977) (Wright, Judge, dissenting). Thus, I would not apply section 1910.212(a)(3)(ii) but, since my colleagues and the judge have applied the standard, I will address the merits of the alleged violation. I believe the record fails to establish a violation.

Respondent performs four distinct riveting operations in its luggage manufacturing plant in Woonsocket, Rhode Island: riveting handles to the suitcase; riveting buckles to shoulder straps, which are then attached to the bag; riveting bumpers, or feet, to the luggage bag; and riveting the frames to the floor of the luggage, and then riveting the frame and floor assembly to the case. The Secretary's compliance officer, Mr. DiCenso, described how different machines were used for different operations. He stated that six machines were used to install handles and that during this installation, an operator's hands could be as little as one inch from the point of operation. Eight machines were used in assembling straps, where the operator's hands were between six and twelve inches from the point of operation, and eleven machines were used to rivet bumpers to the bottom of the suitcase, where the operator's hands would be twelve to eighteen inches from the point of operation. For the bumper attaching operation, there was insufficient clearance for fingers to get within the point of operation.

In attaching the frame to the floor of the luggage and in riveting bumpers on the luggage, a washer was used to strengthen the attachment. The washer was placed on the anvil pilot at the point of operation, after which the operator removed his hands from the point of operation, gripped the sides of the suitcase, and stepped on the foot pedal to operate the rivet press. Moreover, when an employee was riveting the frame to the floor of a piece of luggage and then riveting the frame to the bag, his hands would be a great distance from the point of operation.

The Commission has previously stated that the way a machine functions and the manner in which it is operated by employees must be considered in determining whether it presents a hazard. See Stacey Manufacturing Co., 82 OSAHRC , 10 BNA OSHC 1534, 1537, 1982 CCH OSHD ¶ 25,965 at p. 32,560 (No. 76-1656, 1982); Rockwell International Corp., 81 OSAHRC 118/A2, 9 BNA OSHC 1092, 1097, 1980 CCH OSHD ¶ 24,979 at p. 30,846 (No. 12470, 1980). Moreover, it is during the operating cycle, and not before, that the standard requires that a guarding device protect an employee from having any part of his body in the danger zone. George C. Christopher & Sons, Inc., 82 OSAHRC , 10 BNA OSHC 1436, 1445, 1982 CCH OSHD ¶ 25,936 at p. 32,533 (No. 76-647, 1982). Therefore, guarding is not required if the nature of the machine operation does not expose an employee to injury. Rockwell International Corp., supra; Collator Corp., 76 OSAHRC 32/A2, 3 BNA OSHC 2041, 1975-76 CCH OSHD ¶ 20,446 (No. 2004, 1976).[2/]

---

2/ The judge found that, based on 18,000,000 rivets set and only nine minor injuries occurring during a three year period, the probability of injury from operating a riveting machine is remote. The absence of substantial injuries during years of use is probative evidence that a machine's operation does not present a hazard. See A.E. Burgess Leather Co. v. OSHRC, 576 F.2d 948 (1st Cir. 1978).

Mr. DiCenso's testimony established that employees were not exposed to injury while using the eight machines to rivet straps, since their hands were at least six inches from the point of operation when the machine was activated, and there was no evidence indicating employees had any reason to come in contact with the point of operation during the operating cycle. Similarly, employees operating the eleven machines used to rivet bumpers on to the bottom of the suitcases were holding the suitcases to keep them steady while the machine was activated. Their hands were twelve to eighteen inches from the point of operation when they cycled the press and also were not exposed to injury within the meaning of section 1910.212(a)(3)(ii). Finally, for the operations where the frame was attached to the floor and then the frame and floor assembly attached to the bag, Mr. Stevens, Respondent's Safety Director, testified that employees were holding the outside of the bag while cycling the machine for this operation, and their hands were a great distance from the point of operation. Therefore, during this operation, employees were not exposed to injury. Thus, the record establishes, for all operations except riveting the handle to the suitcase, that employees were not exposed to injury during the operation of the machines.

Mr. Hoyas, a senior loss prevention consultant employed by the company carrying Respondent's workman's compensation policy, stated that rivet machines used in the luggage manufacturing industry generally did not have point of operation guarding. He was familiar with the ring guard protective device, and stated that in riveting the handle to the luggage bag, the handle extended so high above the piece that the ring guard would be physically unable to descend to protect employees. Moreover, Mr. Hoyas stated that he had tested several ring guard units and that the guard malfunctioned in three successive tests. Mr. Hoyas further stated that the workplace configuration did not lend itself to using the ring guard.

Mr. Stevens stated that in riveting shoulder straps to the bag, the operator first places the tab and strap assembly on the anvil and aligns them. The strap is attached to a metal loop, which extends above the strap. He stated that the thickness of the strap assembly and the height of the metal buckle at the point of operation would prevent the ring guard from descending and offering any protection.

Mr. Juechter, a design and mechanical engineer, also concluded that the point of operation of Respondent's rivet machines could not be guarded by any guarding device. He stated that since the materials riveted together are not uniform in shape, quality or thickness, and since many pieces are large and supported on a single point, that no device would work to guard the point of operation. Mr. Juechter's opinion was confirmed by Mr. Stevens who also thought the ring guard would prevent the machine from operating because of the location of the pieces at the point of operation.

Mr. Stevens and Mr. Hoyas both testified why other types of guarding devices also would not work. Mr. Stevens stated that a two-hand trigger guarding device could not be used since both hands were needed to hold the bag on the anvil, that a barrier around the bumper or handle would prevent positioning the work, and that a sweep device would sweep work away from the area. He did not know of a safer way to operate these machines. Mr. Hoyas stated that the workplace configuration and the nature of the work being processed would not allow either an interlock, noninterlock, or movable interlock guard to be used. He continued that two hand controls also were not feasible since the operator must position the work with his hands, and that a pull-back or restraining device would not make the operation any safer since it would be difficult to control the amount of restraint such a device would impart to employees.

The majority concludes that the burden is on Respondent to prove that guarding its machines is "impossible." I believe it is more appropriate to speak, as the courts of appeals do, of permitting the employer to show that compliance with a standard is "infeasible." Faultless Division, Bliss & Laughlin Industries, Inc. v. Secretary of Labor, No. 81-1740 (7th Cir. Mar. 30, 1982); A.E. Burgess Leather Co. v. OSHRC, 576 F.2d 948 (1st Cir. 1978); Ace Sheeting and Repair Co. v. OSHRC, 555 F.2d 439 (5th Cir. 1977); Atlantic & Gulf Stevedores, Inc. v. OSHRC, 534 F.2d 541 (3d Cir. 1976). To impose on an employer a burden of proving impossibility is to impose a burden that is unachievable. Moreover, considering only whether compliance with a standard is literally possible precludes consideration of practical problems associated with compliance. Permitting an employer to defend on the grounds that compliance is infeasible permits practical considerations to be taken into account.

The Secretary presented general testimony that the ring guard was the type of guard most commonly used for riveting machines. Respondent then presented evidence specifically explaining why the use of such guards would be infeasible for its operations. Respondent raised two basic objections to the ring guard: the guard would not provide any protection in certain of Respondent's operations, and the guard was generally unreliable and could not be relied upon to prevent the cycling of a machine when part of an employee's hand was in the point of operation. The Secretary did not attempt to rebut this evidence, but argues that it is not probative because of the asserted lack of qualifications of Respondent's witnesses to offer such testimony. The Secretary also contends that the fact Respondent did not attempt to guard its machines prior to the inspection detracts from the weight that should be afforded Respondent's evidence.

I conclude that Respondent has presented sufficient evidence that guarding is infeasible that the burden shifted to the Secretary to rebut this evidence. As the Secretary failed to present any rebuttal, Respondent has established its defense of infeasibility.

The testimony of Respondent's witnesses establishes that use of the ring guard would not provide any protection in certain riveting operations and would be unreliable in those operations for which it could be used. Contrary to the Secretary's argument, this testimony is entitled to the probative and controlling weight which the judge accorded it since the record reveals that Respondent's witnesses were qualified to offer their testimony. Moreover, the Secretary's enforcement officials, who testified concerning the efficacy of the ring guard, had no experience in luggage manufacturing and had not seen a ring guard used in that industry. Accordingly, their testimony that Respondent could use ring guards is not more persuasive than the contrary testimony of Respondent's witnesses. Ultimate Distribution Systems, Inc., 82 OSAHRC , 10 BNA OSHC 1568, 1982 CCH OSHD ¶ 26,011 (No. 79-1269, 1982) (Rowland, Chairman, dissenting).

The fact that Respondent did not test the ring guard in all of its operations prior to the inspection is not, standing alone, a valid reason to conclude that the testimony of Respondent's witnesses is unreliable. Prior to this inspection, the Secretary had taken the consistent position that Respondent's riveting machines did not require point of operation guarding, and it was the consistent practice in the luggage manufacturing industry to operate riveting machines without point of operation guarding devices. Thus, there was no reason for Respondent to test guarding devices. Moreover, Respondent was not indifferent to the potential hazard its machines presented and had protected its employees as well as possible by covering

the foot pedals used to activate the machines, placing the foot pedals a foot or two away from the point of operation to prevent inadvertent cycling, and giving instructions to employees on how to safely operate these machines. The evidence of the low frequency of accidents shows that these measures were effective. Thus, the record shows that Respondent has done all that is feasible to protect its employees, and the citation should be vacated.

| SECRETARY OF LABOR,<br>Complainant<br>v.<br>AMERICAN LUGGAGE WORKS, INC.,<br>d/b/a AMERICAN TOURISTER LUGGAGE,<br>Respondent | OSHRC DOCKET NO. 77-893 |

Appearances:

Paul Katz, Esq. for Complainant

Patrick A. Liguori, Esq., for Respondent

DECISION AND ORDER

This proceeding arose out of an inspection of American Luggage Works, Inc's, plant at Woonsocket, Rhode Island, on February 16, 1977, where American Tourister brand luggage is manufactured. Two citations alleging violation of The Occupational Safety and Health Act of 1970, 29 U.S.C. section 651 et seq. resulted, but only Item 10 of Citation No. 2 is in issue. All other items mentioned in the two citations have become a final order by operation of law. Item 10 alleged that:

> 29 CFR 1910.212(a)(3)(ii): Point(s) of operation of machinery were not guarded to prevent employee(s) from having any part of their body in the danger zone(s) during operating cycle(s):

The hearing began in Boston, Massachusetts, on November 9 and 10, 1977, resumed on December 21, 1977, and was concluded on March 20, 1978.

## The Issues

The Secretary contends that proof that Respondent's employees' hands came within an inch or less of the point where straps and handles were fastened to luggage by means of riveting machines which had no guards at this point showed that a hazard of serious injury to operators existed and that the burden of proof then shifted to the Respondent to show that the installation of guards would make it impossible to perform the work.

The Respondent, after conceding that there were no guards on the riveting machines, denied violation of the Act because the regulations themselves provide that where there is a particular standard applicable to a method of operation it will prevail over a general standard. 29 CFR section 1910.5(c)(1). Attention was directed to 29 CFR §1910.217 which is applicable to all mechanical power presses and the heading "Excluded Machines", in paragraph (5), where it was stated that:

> "...riveting machines and similar types of fasteners applicators are excluded from the requirements of this section."

The Respondent also contends, assuming arguendo that section 212(a)(3)(ii) is applicable, that there was no violation because there was a failure of the Secretary to prove that a feasible method of guarding exists and, that both practical reasons and company rules made it necessary for the operator's hands to be removed from the point of operation before the machine could be cycled and this was a "method" of operation which satisfies the requirements of section 212(a)(3)(ii).

## Summary of the Testimony

The chief witnesses for the Secretary were Guido DiCenso, the compliance officer who made the February 16th inspection and John Barnes, DiCenso's superior officer who came to the Woonsocket plant to observe Respondent's manufacturing operation on March 25, 1977. This was five weeks after the citation had been issued.

DiCenso has been an OSHA inspection for 3-1/2 years. For 20 years before that he was employed at the United States Construction Battalion Center at Davisville, Rhode Island. For the first 10 or 12 years he was a mechanic repairing all kinds of construction equipment. He later worked as a Production Controller, Contract Specialist and Safety Officer.

Barnes has been a supervising safety specialist with the Department of Labor for about 2 years and a compliance officer for 4 years before that. He had previously been a safety supervisor with Monsanto Chemical Company for 6 years. His only experience with the type of equipment involved, rivet machines, was many years ago when he was self employed in the automobile repair business and used a rivet machine to install brake linings.

The Respondent is a manufacturer of luggage which involves fastening the component parts together with 23 riveting machines in its Woonsocket plant. In order to do this the operator positions the work on the anvil and aligns it in the proper place with his two hands. After his hands have been removed, he depresses a foot pedal about 10 inches away from his foot. This activates the machine and drives the rivet. The pedal is covered with a shroud so that the operator cannot accidentally

step upon the peddle before he removes his hands from the point of operation. The luggage cannot be properly riveted unless the operator removes his two hands from the point of operation to hold the work in place. When he does that his fingers cannot be injured by activation of the machine. Company rules require the operator to refrain from stepping upon the peddle until his hands are removed from the point of operation.

The witnesses for the Secretary, DiCenso and Barnes, said that a ring guard would prevent any accidental or careless movement into the point of operation by the operator and that in failing to install such a device the employer had violated section 212(a)(3)(ii).

The witnesses for the Respondent, on the other hand, said that the use of a ring guard or any other type of guard would make it impossible to perform the work. They both said that if the operators adhered strictly to company rules which required them to avoid activating the riveting machine until the work was in place and their hands removed from the point or operation, no injury would be sustained. See Secretary v. George C. Christofer & Sons., Inc., OSHRC Docket No. 76-647 (1977).

The testimony of three of the Secretary's witnesses supports this opinion. Denis J. Williard, a summer employee, suffered an injury solely because the machine malfunctioned. Francis Boni has worked for the Respondent for more than 3 years as a rivet operator without having any injury. Mary Beattie said that she was injured once but admitted that it was due to her own carelessness. (Tr. IV, p. 83-84). An employer is not in violation when the act or omission complained of is the direct result of the failure to an employee who has had safety training to adhere to

safety requirements, Secretary v. A & W Drill Rentals, Inc., et al, OSHRC No. 271 and 276 (1974); Secretary v. Bechtel Power, 9 OSAHRC 762 (1974).

The Respondent's witness, John W. Juechter, is a consulting engineer. He graduated from Massachusetts Institute of Technology with a degree in mechanical engineering in 1950. After receiving a master's degree in business management from Boston University in 1952, he was employed as a methods engineer for five years, a design engineer for two years, a chief mechanical engineer for five years, and a project and technical advisor to one of the firms engaged in the production of components of the Air Force manned laboratory space project. Since 1970 he has been a partner in his own consulting firm. He has previously testified as an expert in the state and federal courts. When asked how he would compare the machine in question with a mechanical power press he said that a ring guard would be neither effective nor practical. Because of the complexity of the subject his conclusions are best understood when expressed verbatim. He said at Tr. IV, p. 27:

> " It is my opinion that on all of the operations that I observed say but one, the ring guard device would be impractical. The one application where a ring guard might be used was on the operation putting the feet on the bottom of the bag; but since the operator doesn't come anywhere near the anvil with his hands at any time I could see no advantage to doing it, and furthermore because of the size of the bag and the fact that it sits only on a single point anvil the practicality of that operation is questionable with the ring guard."

He had seen ring guards used on a Thompson riveting machine where the product was a small eye protection device where the parts fit together neatly (Tr. IV, p. 52) but:

" The problem here in trying to adapt the ring guard device which basically depends upon some configuration of material dropping down to clear — let's say, dropping down to be certain that the operator's fingers are clear of the work place, this depends — excuse me. For the device to work properly, it has to drop to a predetermined distance, and considering the fact that the materials being riveted together are not uniform in quality; they're not uniform in shape; they ripple; they're soft; they vary in thickness; the pieces that are being riveted are large in size in many cases and they're being supported on a single point, and I think it is impractical to try and set up a ring guard to do this and I know of no other device that would work either." (Tr. IV, p. 31)

He said that as long as the methods of procedure in force at Tourister are followed by the riveting machine operators, even if the fingers were within an inch of the point of operation at the time of cycling, there was no chance of injury (Tr. IV, p. 55, l. 19, 20).

This witness also disagreed with the Complainant's assumption that guarding meant only that a mechanical device which barred entry of the fingers into the point of operation met the requirements of the regulation. He pointed out that covers over mechanical moving parts and power transmission equipment, anti-repeat controls and installation of foot controls at a point removed from the area where the operator stands prior to cycling the machine all were types of guarding. Covering the pedal with a shroud is another method.

The Respondent's witness, Marshall Hoyas, has been a Senior Loss Prevention Consultant for Liberty Mutual Insurance Company for 12 years and as such has visited Respondent's Woonsocket plant on numerous occasions. The Secretary sought unsuccessfully (because his questions on cross-examinations were ruled irrelevant at trial) to ascertain if Hoyas' conclusions were consistent with those of Liberty Mutual. Matters which

have been ruled upon at trial, although a proper subject for discussion in a petition for review, should not be reasserted in a post hearing brief. In any event it is unlikely that Liberty Mutual's loss control expert would express opinions which would be contrary to its objective, that is to keep to a minimum claims for lost time industrial accidents as the Respondent's workmen's compensation carrier. Obviously the objective of Liberty Mutual is wholly compatible with the purpose of the Occupational Safety and Health Act, safety in the workplace. For that reason Mr. Hoyas' opinion based upon his knowledge of the manner of fabricating luggage at Woonsocket and upon his tests and observations is entitled to more weight than that of DiCenso who only observed the process for 30 minutes.

Hoyas said that the Respondent's operating procedure was adequate (Tr. III, p. 163; p. 210, p. 264). Under ANSI standards there are four safety procedures for this type of machine:

1. Training
2. Work Place Configuration
3. Size and arrangement of work force
4. Use of both hands to hold the work (Tr. III, p. 165-166).

He said that a ring guard was prone to malfunction and, for that reason, was not a satisfactory protection device (Tr. III, p. 172). When he had tested a rivet machine equipped with a ring guard by inserting a ball point pen in the point of operation the ring guard failed. The pen which he exhibited at the hearing had a rivet through it (Tr. III, p. 183). In the course of his responsibilities as a loss consultant he had visited the Respondent's plants periodically. In his opinion the accidents which had

occurred in the previous 5 years would not have happened if the affected employees had complied with company safety rules (Tr. III, p. 225).

The Secretary's expertise in the instant case was manifested through the conclusions of DiCenso and Barnes whose sincerity and verocity is not in doubt. However, the superior knowledge and experience of Juechter and Hoyas who also were credible witnesses shows conclusively that a ring guard could not be used on the Respondent's riveting machines. To so conclude is not equivalent to saying that DiCenso's and Barnes' opinions were without merit. Juechter told of his experience in the plant of another manufacturer where a different product was fastened by means of rivets where a ring guard was practical, but he also said that because the size and shape of the luggage made by the Respondent was different than that in the other plant ring guards could not be used. Hoyas on the basis of his knowledge of these procedures and tests he had made reached the same conclusion.

If the preponderance of the evidence shows that it would be both impossible and impractical to do what the Secretary alleges should have been done, then there cannot be a violation of section 212(a)(3)(ii). For that reason it is unnecessary to dispose of the contention of the Respondent that section 217 excludes riveting machines from compliance with section 212. It would be difficult to reject this argument in view of the fact that this is exactly what section 217 says.

However, even if it were assumed that the provisions of section 212 are applicable to riveting machines, no violation occurred.

There is credible, reliable and probative evidence (1) that no employee could be injured if he is attentive to his duties and follows prescribed procedures, (2) that if a ring guard were used, the work could not be done, (3) that no other type of guard would be feasible (4) and that tests of a ring guard on similar machines have demonstrated that it is not reliable. It frequently failed to operate as designed.

The Law

If a regulation does nothing more than create, in effect, a general duty of the employer to meet a standard without stating what specific employer conduct is required for compliance, the burden rests upon the Secretary to show what the employer should have done. General Electric Co. v. Secretary, 540 F.2d 67, 69 (2d Cir. 1976); National Realty and Construction Co., Inc. v. Secretary, 489 F.2d 1268 (1973).

In a manufacturing procedure where the operator's hand comes within an inch of the point of operation and the materials riveted are so varied that the machine would have to be reset after each cycle, the use of a guard would be economically infeasible, impractical and therefore not required. Secretary v. Executone, Inc., OSHRC Docket No. 76-559 (1978). If, the employer has a program of periodic and regular inspection followed by written reports and safety meetings, he has done all he is required to do under 29 CFR section 1910.212(a)(3)(ii). Secretary v. Christoforos and Sons, OSHRC Docket No. 76-647 (1977).

The Complainant after referring to the case of Secretary v. Sheet Metal Specialty Co., OSHRC No. 5622 (April 22, 1975) made the inaccurate and wholly unnecessary comment that the Commission "...in reversing several errors of the Administrative Law Judge..." (Judge Chaplin) held that

29 CFR section 1910.217 does not preempt 29 CFR section 1910.212. A majority did so hold but chiefly to be consistent with their prior ruling in Secretary v. Irvington-Moore, OSHRC No. 3116 (April 7, 1975) decided a year after Judge Chaplin's decision.

Moreover it is not as the Complainant says, most close to the case at bar. In Sheet Metal the Respondent's own witness conceded that a system could be devised to keep the operator's hands out of the danger area. In the case at bar not only has the employer consistently disputed the allegation that the installation of guards on rivet machines was feasible, but also has sustained the burden of proof of impossibility of compliance.

The Complainant overemphasized the significance of the Commission decision in Secretary v. K & T Steel Corp., OSHRC Docket No. 5769 (1976). The employer's evidence in that proceeding consisted solely of unsupported assertions of the manufacturer that no guards were available. That was not true of the case at bar.

In Secretary v. Akron Brick & Block Co., OSHRC Docket No. 4859 (1976) a majority of the Commission held that the method of machine guarding should not be "predominantly" dependent upon human behavior thus indicating that this is in fact one of the "methods" permitted by section .212(a)(1) yet at the same time concluded that work rules "...are not methods of machine guarding contemplated by the standard."

In Secretary v. Garrison & Associates, OSHRC Docket No. 4235 (1975) the Respondent appeared pro se and offered no witnesses, so that this opinion is of no significance.

In Secretary of Labor v. F. H. Lawson Co., OSHRC Docket No. 12883 (1976) cited for the purpose of showing that the burden of establishing

impossibility of performing the work with a guard on a riveting machine, the employer not only offered no proof of any attempt to guard its riveting machines, but also failed to offer any proof of impossibility of performance which is not analagous to the facts in the case at bar where the employer offered substantial expert testimony in support of its contention that it was impossible to install guards and still produce the product being fabricated. This case is now on review before the Commission.

In Secretary v. Zachry Co., OSHRC Docket No. 76-2617 (pending on review) the trial judge held there was no violation where employees could not enter the zone of danger except by deliberate action and that this would be possible (as in the case at bar) even if the machine had guards.

The Respondent has called attention to that clear and plain statement made by the Secretary through the promulgation of 29 CFR section 1910.217(a)(5) under the heading "Excluded Machines" which says that: "...riveting machines and similar types of fastener applicators are excluded from the requirements of this section." The Secretary has not discussed this section, but as the Respondent points out, Judge Cronin in Secretary v. Brown-Jordan Co., OSHRC Docket No. 3982 (1974) and Judge Gold in Collier Construction Co., OSHRC Docket No. 4036 (1974) have held that since section 217 is a specific standard, it prevails over section 212, a general standard, and vacated a section 212 citation. On the other hand, the 9th Circuit Court of Appeals in Gem Top v. Secretary, 556 F.2d 431 (1977) after summarizing the legislative history of sections 212 and 217, decided solely upon the assumed expertise of the Secretary that his argument should be accorded the most weight. However, I don't find this opinion

to be very persuasive when the concurring member of this panel made it clear that he did so reluctantly and solely because of the "expertise" rule. The concurring member said at 436:

> " I concur under the compulsion of the "deference rule" and Judge Lumbard's analysis of the applicability of 654(a)(1) and 655(a) of 29 U.S.C.
>
> In so doing, it is my hope that we are not promoting "delay [of] the day when the occupational safety and health regulations will be written in clear and concise language so that employers [and others concerned] will be better above to understand and observe them." Diamond Roofing v. OSHRC, 528 F.2d 645, 650 (5th Cir. 1976)"

The dissenting member said:

> " An employer is entitled to fair notice when dealing with the Government. An occupational safety and health standard must give an employer fair warning of the conduct which it prohibits or requires. Diamond Roofing v. OSHRC, 528 F.2d 645, 649 (5th Cir. 1976). The regulations in issue do not give this fair warning.
>
> I believe that the employers could properly have assumed that the specific standards of 29 C.F.R. §1910.217 controlled over the more general 29 C.F.R. §1910.212. This is even more supportable when the differing opinions of the administrative law judges and commissioners below are considered.
>
> A statute which is so vague that men of common intelligence must necessarily guess at its meaning and differ as to its application violates due process. Connally v. General Construction Co., 269 U.S. 385, 391, 46 S.Ct. 126, 70 L.Ed. 322.
> This rule applies to regulations. See Boyce Motor Lines, Inc. v. United States, 342 U.S. 337, 72 S.Ct. 329, 96 L.Ed. 367."

The legislative history of section 1910.212 and 1910.217 is bewildering. According to Judge Lumbard for the majority at page 434:

" The two guidelines at issue in this case come from different sources. See 29 C.F.R. §1910.22. The precursor of 29 C.F.R. §1910.212 was a regulation promulgated by the Secretary of Labor in 1969 under the Walsh-Healey Public Contracts Act, 41 U.S.C. §§35(e), 38. On the other hand 29 C.F.R. §1910.217 was derived from consensus standards devised in 1971 by the American National Standards Institute ("ANSI"), a private organization made up of industry representatives and some representatives of labor and government. 6

Since in this case the Secretary's interpretation of his own regulations has been affirmed by the Commission, this interpretation must be accorded substantial weight. (Citations omitted)

Court review here serves only to ensure against circumvention of the public rulemaking process or punishment of employers without fair notice. See, e.g., Diamond Roofing Co. v. OSHRC, 528 F.2d 645, 649 (5th Cir. 1976). Our task is to determine whether the agency's reading of the regulations is reasonable and whether the regulations are not unduly vague.

******

6. Since the promulgation of the power-press guidelines, ANSI has developed safety standards for press brakes. These were published by ANSI in 1973, but they have not been promulaged under OSHA. Petitioners argue that ANSI would not have produced these separate guidelines except on the assumption that press brakes are not covered under existing OSHA regulations.

We find this reading of ANSI's motives unpersuasive; ANSI may have felt simply that it would be desirable to have more detailed standards for press brakes than are supplied in 29 C.F.R. §1910.212. In any event, since §1910.212 is derived from the Walsh-Healey standard rather than from ANSI, ANSI's interpretation of that section is not entitled to weight. See generally National Roofing Contractors Ass'n v. Brennan, 495 F.2d 1294, 1298 (7th Cir. 1974), cert. denied, 419 U.S. 1105, 95 S.Ct. 775, 42 L.Ed.2d 801 (1975)"

## Findings of Fact

Upon consideration of the above mentioned facts I find that:

1. The Respondent was at the time of the inspection and at all times subsequent thereto material to the issues in this proceeding an employer subject to the jurisdiction of the Commission in any proceeding under the provisions of the Occupational Safety and Health Act of 1970.

2. The feasibility of the installation of a ring guard as recommended by employees of the Complainant without notable professional experience is not persuasive when weighed against the findings of an insurance company loss control specialist based upon tests and periodic inspections whose objective is consistent with that of OSHA, the prevention of injuries in the workplace, and the opinions of a professional engineer who had also observed the manufacturing process.

3. A rivet machine is a power press.

4. The installation of a ring guard on the Thompson riveting machines in the Respondent's Woonsocket manufacturing plant would be neither feasible nor beneficial to the safety of employees.

5. The operating procedures established by the Respondent, if adhered to by employees, are sufficient to preclude serious injury or death in the operation of riveting machines.

## Conclusions of Law

1. The Respondent is an employer subject to the provisions of the Occupational Safety and Health Act of 1970.

2. Assuming without deciding that 29 CFR section 1910.212 (a)(3)(ii) is applicable to riveting machines, in view of the fact that

6,000,000 operating cycles are performed annually at the Woonsocket plant and a total of about 18,000,000 rivets were set and only nine minor injuries occurred in a three year period[1/] one of which was due to the negligence of the employee and another due to a machine malfunction, it is plain to be seen that the probability of injury due to the absence of a guard is remote. The Secretary failed to adduce credible, persuasive evidence showing what the employer should have done and some basis for concluding that further efforts would have been feasible and successful. For those reasons, the allegation that the Respondent violated 29 CFR section 1910.212(a)(3)(ii) cannot stand. See General Electric Co. v. Secretary of Labor, 540 F.2d 67, 70 (2nd Cir. 1976).

3. Accordingly, it is unnecessary to decide whether 29 CFR section 1910.217 is applicable to riveting machines.

Order

It is therefore hereby ordered that Item 10, Citation No. 2, dated March 3, 1977, and the proposed penalty thereon be vacated.

DECISION

Before ROWLAND, Chairman; CLEARY and COTTINE, Commissioners.

BY THE COMMISSION:

A decision of Administrative Law Judge Henry F. McQuade is before the Commission pursuant to section 12(j), 29 U.S.C. § 661(i), of the Occupational Safety and Health Act of 1970, 29 U.S.C. § 651-678 ("the Act"). Judge McQuade found that Respondent, Bethlehem Steel Corporation ("Bethlehem"), was in serious violation of 29 C.F.R. §§ 1910.252(f)(4) and (f)(5)[1/]

---

1/ 29 C.F.R. § 1910.252(f)(4) and (f)(5) provide in pertinent part:

§ 1910.252 Welding, cutting, and brazing.

* * *

(f) Health protection and ventilation--

* * *

(4) Ventilation in confined spaces -- (i) Air replacement. All welding and cutting operations carried on in confined spaces shall be adequately ventilated to prevent the accumulation of toxic materials

(continued on next page)

or 1916.31(a) and (b)[2/] because its workers were exposed to excessive levels of fluorides.

---

1/ (continued)

> or possible oxygen deficiency. This applies not only to the welder but also to helpers and other personnel in the immediate vicinity. All air replacing that withdrawn shall be clean and respirable.
>
> (ii) Airline respirators. In such circumstances where it is impossible to provide such ventilation, airline respirators or hose masks approved by the U.S. Bureau of Mines for this purpose shall be used.
>
> * * *
>
> (5) Fluorine compounds - (1) General. In confined spaces, welding or cutting involving fluxes, coverings, or other materials which contain fluorine compounds shall be done in accordance with paragraph (f)(4) of this section. A fluorine compound is one that contains fluorine, as an element in chemical combination, not as a free gas.
>
> (ii) Maximum allowable concentration. The need for local exhaust ventilation or airline respirators for welding or cutting in other than confined spaces will depend upon the individual circumstances. However, experience has shown such protection to be desirable for fixed-location production welding and for all production welding on stainless steels. Where air samples taken at the welding location indicate that the fluorides liberated are below the maximum allowable concentration, such protection is not necessary.

The term "confined space" under these standards is defined at 29 C.F.R. § 1910.252(e)(4) as follows:

> (4) Work in confined spaces - (i) General. As used herein confined space is intended to mean a relatively small or restricted space such as a tank, boiler, pressure vessel, or small compartment of a ship.

2/ 29 C.F.R. § 1916.31(a) and (b) provide:

> § 1916.31 Ventilation and protection in welding, cutting and heating.

(continued on next page)

This case presents the questions of whether the general industry standards in Part 1910 or the maritime standards in Part 1916 should

---

2/ (continued)

(a) Mechanical ventilation; requirements. (1) For purposes of this section, mechanical ventilation shall meet the following requirements:

(i) Mechanical ventilation shall consist of either general mechanical ventilation systems or local exhaust systems.

(ii) General mechanical ventilation shall be of sufficient capacity and so arranged as to produce the number of air changes necessary to maintain welding fumes and smoke within safe limits.

(iii) Local exhaust ventilation shall consist of freely movable hoods intended to be placed by the welder or burner as close as practicable to the work. This system shall be of sufficient capacity and so arranged as to remove fumes and smoke at the source and keep the concentration of them in the breathing zone within safe limits.

(iv) Contaminated air exhausted from a working space shall be discharged into the open air or otherwise clear of the source of intake air.

(v) All air replacing that withdrawn shall be clean and respirable.

(vi) Oxygen shall not be used for ventilation purposes, comfort cooling, blowing dust or dirt from clothing, or for cleaning the work area.

(b) Welding, cutting and heating in confined spaces. (1) Except as provided in paragraphs (b)(3) and (c)(2) of this section, either general mechanical or local exhaust ventilation meeting the requirements of paragraph (a) of this section shall be provided whenever welding, cutting or heating is performed in a confined space.

(2) The means of access shall be provided to a confined space and ventilation ducts to this space shall be arranged in accordance with § 1916.46(b)(1) and (2).

(3) When sufficient ventilation cannot be obtained without blocking the means of access, employees in the confined space shall be protected by air line respirators in accordance with the requirements of § 1916.82(a), and an employee on the outside of such a confined space shall be assigned to maintain

(continued on next page)

apply to the alleged violative condition and whether the violations, if any, were serious or nonserious.[3/] The Commission must also decide whether the tests performed by the compliance officer were accurate and whether the Secretary withdrew his original charge under 29 C.F.R. § 1910.1000, the general standard covering exposure to air contaminants.

I

Pursuant to an employee complaint, compliance officers from the Occupational Safety and Health Administration ("OSHA") inspected Bethlehem Steel's shipyard facility at Sparrows Point, Maryland. During this inspection, the compliance officers noted that welders, working in triangular 6-foot by 7-foot areas, were not wearing respirators despite the fact that the welding being performed created a bluish-gray, smoky haze typical of fluoride particle contamination.

---

2/ (continued)

> communication with those working within it and to aid them in an emergency.

The definition of "confined space" under this standard is found in 29 C.F.R. § 1916.2(m), which provides:

> (m) The term "confined space" means a compartment of small size and limited access such as a double bottom tank, cofferdam, or other space which by its small size and confined nature can readily create or aggravate a hazardous exposure.

3/ Commissioner Cottine directed review on all issues raised by the petition, including the following:

> Whether the judge erred in finding the Respondent in serious violation of 29 C.F.R. §§ 1910.252(f)(4) and (f)(5) and §§ 1916.31(a) and (b), based on the exposure of an employee to fluorides for an 8-hour time weighted average of 5.3 mg/M3.

Several days later, the compliance officers returned to the shipyard to obtain a measurement of the fluoride exposure level of the welders. The officers clipped a sampling cassette on the shirt collar of a Bethlehem welder, Mr. Hancock. On this day, Mr. Hancock was working in a triangular bulkhead of a ship. The bulkhead was approximately 239 cubic feet and had a small 15-inch by 23-inch opening. Ventilation was provided by two small mechanical blowers. The compliance officers and Bethlehem welders testified that the blowers were unable to ventilate the area completely and the bulkhead filled with a bluish haze.

Mr. Hancock was wearing a Wilson 1200 negative pressure respirator. However, despite the respirator, Mr. Hancock discharged black nasal mucus at the end of his eight-hour shift. This, according to the compliance officers, indicated that the seal of the respirator was ineffective. The tests performed by the OSHA officials indicated that Mr. Hancock was exposed to a time weighted level of 5.3 $mg/M^3$ of fluorides, more than twice the allowable level for fluoride exposure set forth in 29 C.F.R. § 1910.1000(a)(2), Table Z-1[4/].

---

4/ 29 C.F.R. § 1910.1000(a)(2) requires employee exposure to air contaminants to be limited to the time weighted average given in Table Z-1. 29 C.F.R. § 1910.1000(e) provides:

> To achieve compliance with paragraphs (a) through (d) of this section, administrative or engineering controls must first be determined and implemented whenever feasible. When such controls are not feasible to achieve full compliance, protective equipment or any other protective measures shall be used to keep the exposure of employees to air contaminants within the limits prescribed in this section. Any equipment and/or technical measures used for this purpose must be approved for each particular use by a competent industrial hygienist or other technically qualified person. Whenever respirators are used, their use shall comply with § 1910.134.

The Secretary alleged that Bethlehem committed a serious violation of 29 C.F.R. §§ 1910.1000(a)(2) and 1910.1000(e), the general standards for exposure to toxic substances. The complaint also cited Bethlehem for serious violations of 29 C.F.R. § 1916.31(a) and (b). The complaint was subsequently amended to include serious violations of 29 C.F.R. § 1910.252(f)(4) and (5).

Judge McQuade found that the Bethlehem employees had been exposed to more than twice the allowable level of fluoride. Therefore, he held that Bethlehem had violated section 1910.1000(a)(2). He also found that Bethlehem had violated sections 1910.252(f)(4) and (5) or, alternatively, sections 1916.31(a) and (b) because Bethlehem had failed to provide adequate ventilation for the employees welding in a confined area. Judge McQuade assessed $700 for the violation.

Judge McQuade's decision became a Review Commission final order when no Commissioner directed the case for review. Bethlehem Steel Corp., 78 OSAHRC 70/A2 (No. 77-1807, 1978). However, Bethlehem appealed the Review Commission's final order to the Court of Appeals for the Third Circuit.

The court remanded the case to the Commission for further proceedings. Bethlehem Steel Corp. v. OSHRC, 607 F.2d 1069 (3rd Cir. 1979). In its decision, the court vacated that part of Judge McQuade's decision which held that Bethlehem had violated section 1910.1000(a)(2). The court determined that when the Secretary had amended his complaint he had withdrawn the charges under sections 1910.1000(a)(2) and (e).

Next, the court held that Judge McQuade had made insufficient findings to support his conclusion that the violations of sections 1916.31 (a) and (b) and 1910.252(f)(4) and (5) were serious. The court held

that Judge McQuade's findings did not meet the minimum standards of the Administrative Procedure Act, 5 U.S.C. §§ 551-706. The court stated,

> At a minimum, the ALJ's findings in this case should have indicated the evidentiary basis for his conclusion that the possible accumulation of excess fumes and smoke due to inadequate ventilation in Hancock's workspace created a substantial probability of death or serious physical injury to him, and that Bethlehem with reasonable diligence could have known of the violation. Yet, examination of the ALJ's decision reveals that absolutely no findings were made with respect to the alleged seriousness of the violation. The ALJ simply concluded that the violation was serious.

607 F.2d at 1073. Accordingly, the court remanded the case for the following determinations:

> [W]hether the allegations in the complaint may be read to permit the Government to introduce evidence concerning the company's practices prior to the date of the inspection, to consider whether Hancock's activities prior to the date of inspection may have warranted a finding that the conduct in issue constituted a serious violation, and to make any further findings of fact that may be appropriate in the circumstances.

607 F.2d at 1074. The Commission remanded the case to Judge McQuade and, in a very brief hearing on June 17, 1980, both sides declined to present any new evidence.

In his second decision, Judge McQuade again found that the facts supported findings that Bethlehem had failed to comply with both the general industry and maritime standards. Judge McQuade also said that the court had erred in holding that the Secretary had withdrawn the allegation of violation of section 1910.1000(a)(2). According to Judge McQuade, when he considered the Secretary's proposed amendment, he had treated the amendment as a request to proceed as an alternative to the original allegation of violation of 29 C.F.R. § 1910.1000(a)(2). Therefore, he reasoned that this charge was still before him, and he reaffirmed his prior finding that the standard had been violated.

Judge McQuade also stated that the court misconstrued Commission law when it stated,

> Our threshold inquiry must be whether Bethlehem's alleged noncompliance may be deemed 'serious,' for we need not reach the question of whether the substantive requirements of the standards were violated if such violations may not be characterized as serious.

Judge McQuade went on to observe that, under Commission precedent, a determination is made whether a violative condition existed before the classification of the violation is considered. A violation is serious if it is substantially probable that the result of an incident could be serious injury or death.

Judge McQuade found the violations in this case to be serious.[5/] The judge quoted extensively from Dr. Houten's expert testimony on the chronic effects of fluoride exposure. The judge found that a single exposure to excess fluoride could constitute a serious violation.

---

5/ Judge McQuade made the following findings of fact:

1. Respondent had knowledge or with the exercise of reasonable diligence should have had knowledge of the conditions present in that they assigned an employee, whose normal job function was welding, to work in a confined space without adequate ventilation where the fluoride levels exceed those permitted by regulation.

2. As testified to by Dr. Lorne Houten, exposure to excessive levels of fluorides may acutely affect respiratory, gastrointestinal, and neurological systems causing serious physical harm such as shortness of breath, burning of the nasal passages and buccal cavity, coughing, vomiting, diarrhea, abdominal cramps, headaches and faintness.

3. As testified to by Dr. Houten, short term exposure to fluorides may cause chronic serious physical effects on dentition and the skeletal system. This can cause increased growth of many of the bone elements with possible crippling effects on those exposed to the fluorides.

II

Bethlehem argues that the shipbuilding, rather than general industry, standards apply to the operaton in question but Bethlehem contends that it did not violate any of the cited standards. First, Bethlehem argues that the space in which the employees were welding was not a confined space in that Mr. Hancock had ample room in which to move. In any event, Bethlehem contends that the term "confined space" is unconstitutionally vague.

Bethlehem also objects to the method by which the compliance officer conducted the tests, contending that the testing cassette should have been clipped under the employee's welding hood and not on the lapel of his work shirt. Bethlehem argues that placement of the cassette under the hood which the employee wore while welding would have more closely approximated the actual breathing zone of the employee.

Bethlehem also contends that the Secretary never demonstrated that a feasible means of ventilation existed which would have brought Bethlehem into compliance with the standards. Bethlehem states that the Secretary never presented evidence on this point because there was no feasible means of ventilation to assure compliance with the standards.

Finally, Bethlehem takes issue with the characterization of the alleged violations as serious because ventilation had been provided and the employee was wearing a respirator. Bethlehem also states that the Secretary never produced evidence concerning the number of employees similarly exposed, the length of employee exposure, or actual harm to exposed employees.

The Secretary argues that Judge McQuade's decision should be affirmed. However, the Secretary, like Bethlehem, takes the position

that the maritime standards and not the general industry standards are the applicable standards.

III

Both parties agree that the maritime standards rather than the general industry standards apply.[6/] The welding was being performed inside a swash bulkhead on Table 12 at the Sparrows Point Shipyard. The unit being worked on was to become part of a Liquid Natural Gas tanker. This constitutes "shipbuilding or a related employment." See 29 C.F.R. § 1910.14. Moreover, the requirements of the maritime and the general industry standards, charged in the alternate, are basically the same. Accordingly, we apply the maritime standards in Part 1916.[7/]

A

Bethlehem's "confined space" argument is governed by Commission precedent. Sections 1916.31(a) and (b) forbid welding in a "confined space" without proper ventilation. In Dravo Corp., 80 OSAHRC 2/B10, 7 BNA OSHC 2095, 1980 CCH OSHD ¶ 24,158 (No. 16317, 1980), pet. denied without opinion, No. 80-1267 (3rd Cir. 1980), the Commission held that

---

6/ We set aside the judge's decision to the extent he found that Bethlehem violated 29 C.F.R. §§ 1910.1000(a)(2). The Third Circuit unequivocally held that this charge had been withdrawn. Following judicial review under section 11(a) of the Act, 29 U.S.C. § 660(a), the decision of the reviewing court is the law of the case, see Briggs v. Pennsylvania R.R., 334 U.S. 304, 306 (1948). The Commission and its administrative law judges are required to comply with remand orders of the courts of appeals. Butler Lime and Cement Co. v. OSHRC, 658 F.2d 544 (7th Cir. 1981); Frank Irey, Jr., Inc., 77 OSAHRC 192/F11, 5 BNA OSHC 2031, 1977-78 CCH OSHD ¶ 22,283 (No. 701, 1977).

7/ Because both parties agree that the maritime standards apply to the facts of this case, Chairman Rowland believes it is unnecessary for the Commission to independently determine that the maritime standards apply. Chairman Rowland therefore expresses no opinion on whether the work being done at the time of the alleged violation was "shipbuilding or a related employment."

a compartment on a barge with a cubic area sixty times the cubic area of the bulkhead in this case was a "confined space" under section 1916.2(m).[8/] The Commission reasoned that the compartment had very limited access and no natural ventilation, thereby aggravating workers' exposure to welding fumes. The area in this case exhibited these characteristics. The bulkhead was very small and only had a small access hole. There was little or no natural ventilation. Accordingly, we conclude that the cited area was a "confined space" within the meaning of section 1916.31(b).

The artificial ventilation provided by Bethlehem was clearly inadequate. Section 1916.31(a) requires that ventilation be provided that is of sufficient capacity to maintain welding fumes and smoke "within safe limits." Several employees testified that a bluish-gray, smoky haze developed and lingered throughout welding operations. The inadequacy of the artificial ventilation was further demonstrated by the results of the atmospheric testing. Based on the monitoring results, Dennis Hancock was exposed to more than twice the permissible level of fluorides. Accordingly, fumes and smoke were not maintained within safe limits.[9/]

---

8/ The Commission also held in Dravo Corp., supra, that the definition of a "confined space" under the maritime standards was not unconstitutionally vague. While acknowledging that the standard requires an employer to use his judgment and experience to determine whether a space is a confined space, the Commission noted that the standard is not unconstitutionally vague simply because judgment must be exercised in determining its application. A standard must be read in light of the conduct to which it is addressed.

9/ Although the maritime standards require that welding fumes and smoke be maintained "within safe limits," the term is not specifically defined. All three Commissioners find 2.5 $mg/M^3$ to be a proper reference for determining employee exposure to fluorides under the maritime standards. However, the Commissioners differ on their reasons for this finding.

(continued on next page)

We are not convinced, from Bethlehem's strenuous argument, that the test results indicating that Mr. Hancock was exposed to twice the permissible level of fluorides were invalid. First, Mr. Hancock testified that he buttoned his collar in such a way that the cassette was located under the hood during welding operations. Second, the cassette was within several inches of Hancock's nose and mouth and therefore within his "breathing zone." Finally, measurements made by Bethlehem on the same day as the Secretary's tests yielded results that are not inconsistent with the Secretary's. We affirm Judge McQuade's finding of fact that the test results were valid.

Bethlehem's argument that the citation should be vacated because the Secretary failed to establish the feasibility of additional ventilation is without merit. Commissioners Cleary and Cottine conclude that the Secretary does not have the burden of proving the feasibility under this specific duty standard. See Marion Power Shovel, 80 OSAHRC 110/A2, 8 BNA OSHC 2244, 2247, 1980 CCH ¶ 24,915 at p. 30,729 (No. 4114, 1980). Nevertheless, an industrial hygienist testifying on behalf of

---

9/ (continued)

In the circumstances of this case, Chairman Rowland and Commissioner Cleary find that the unrebutted expert testimony indicates that 2.5 $mg/M^3$ is an appropriate reference for determining whether an employee's exposure to fluorides in welding fumes is "within safe limits" within the meaning of § 1916.31(a).

Commissioner Cottine notes that the maritime standards do not contain threshold limit values for harmful substances. However, the general industry air contaminant standard at 29 C.F.R. § 1910.1000(a)(2), Table Z-1, lists 2.5 $mg/M^3$ as the maximum 8-hour time weighted average for employee exposure to fluoride. Commissioner Cottine would hold that in the absence of a specifically applicable maritime standard, the general industry time weighted average is an appropriate reference for determining whether welding smoke and fumes are within safe limits.

the Secretary described several methods for improving the ventilation in the confined space.[10/]

Under the explicit terms of the standard, if the work is being performed in a confined space and adequate ventilation is not supplied, the employees are to be protected by airline respirators in accordance with section 1916.82(a). Bethlehem failed to comply with this requirement. It only provided a Wilson 1200 negative pressure respirator that was inadequate to filter the fluoride particles. Since the space in which the work was being performed was a confined space and since the ventilation and the respirator were inadequate, Judge McQuade's finding that Bethlehem violated sections 1916.31(a) and (b) is affirmed.[11/]

B

The final question is whether the violation is a serious violation. In order to establish a serious violation, the Secretary must establish that Bethlehem knew or should have known of the violative condition and that the violation gave rise to a substantial probability of death or serious physical harm. 29 U.S.C. § 666(j). In this case,

---

10/ Chairman Rowland agrees that the record demonstrates the feasibility of additional ventilation and therefore finds it unnecessary to determine which party has the burden of proof on the issue. Chairman Rowland does not agree that the standard is a "specific duty standard" in all respects. See note 9 supra.

11/ Chairman Rowland finds a violation of these standards based solely on the inadequacy of the existing ventilation. The Chairman does not join in this decision to the extent it concludes that Bethlehem is required under these standards to provide airline respirators. He notes that the only reference to such respirators appears at section 1916.31 (b)(3), which is limited to situations where sufficient ventilation cannot be provided. Since the evidence demonstrates that Bethlehem could feasibly have provided adequate ventilation, the Chairman would not impose on Bethlehem any obligation to use a type of respirator other than that which its employee was wearing.

testimony established that Bethlehem knew that the welding involved fluorides. Accordingly, Bethlehem's knowledge was established. With respect to the health effects of excessive fluoride exposure, the record establishes that long-term exposure can result in permanent harmful effects on the skeletal and neurological systems, as well as permanent discoloration of the teeth. However, even though the expert stated that continued exposure to fluorides at the levels to which Hancock was exposed could result in serious chronic effects, the evidence in this case indicates only one instance of exposure. The expert testimony establishes that acute reactions to fluoride exposure include nonserious problems such as shortness of breath, nausea, and vomiting.[12/] However, the testimony indicates that the levels to which employees may be exposed varies greatly depending on weather conditions, ventilation, where

---

12/ Judge McQuade found that short term exposure to fluorides may have chronic serious effects on a person's teeth and skeleton. See note 5 supra. We do not believe this finding is supported by a preponderance of the evidence. Specifically, Dr. Houten, the Secretary's expert witness testified,

> A . . . the literature is consistent with saying that a five to ten-year exposure could produce noticeable effects, and a longer exposure would be more likely to produce noticeable effects.
>
> Q And what effect would that be, in five to ten years?
>
> A Well, one would find radiographic changes in the bone, which could have the effect of limiting joint motion, arthritic changes. It could in severe cases even ultimately lead to loss of use of joints, through pain and stiffness, . . .

The witness also stated that radiographic evidence of fluoride exposure has been noted with as little as six months exposure. Therefore, the record establishes only that serious chronic effects from the exposure to fluorides would require more than the short-term exposure involved in this case.

the welding is performed and whether a respirator is used. Although Mr. Hancock had been a welder for eleven years, the record before us does not establish the length or level of his exposure to fluorides for times other than the inspection involved in this case.

We reverse Judge McQuade and find the violation was nonserious. Evidence that exposure could vary greatly according to weather conditions, location and other factors is sufficient to rebut a presumption that the employee's exposure on the day of the inspection was typical of the level of long term exposure. See Hermitage Concrete Pipe Co., 82 OSAHRC , 10 BNA OSHC 1517, 1982 CCH OSHD ¶ 25,975 (No. 4678, 1982). Moreover, the record does not establish that short term exposure to fluorides at the levels shown to exist in this case gives rise to a substantial probability of death or serious physical harm. Under the circumstances, the exposure must be considered short term and the violation nonserious.[13/] After considering the factors enumerated in section 17(k) of the Act, 29 U.S.C. § 661(j), we assess a penalty of $500.

SO ORDERED.

FOR THE COMMISSION

Ray H. Darling Jr.

RAY H. DARLING, JR.
EXECUTIVE SECRETARY

DATED: MAY 28 1982

---

13/ Chairman Rowland does not agree with the Commission's analysis in Hermitage Concrete Pipe Co., supra, and would hold that the Secretary has not proven that the employee was exposed to a level of fluorides which was likely to cause death or serious harm. See Hermitage, supra (Rowland, Chairman, dissenting).

## DECISION AND ORDER ON REMAND

Appearances:

Matthew J. Rieder, Esq.,
for the Complainant

Jack D. Shoffner, Esq.
for the Respondent

Murphy M. Thornton,
for the Employees

McQUADE, Judge:

This proceeding was commenced under section 10(c) of the Occupational Safety and Health Act of 1970, 29 U.S.C. § 651 et seq., (herein "the Act").

On November 9 – 11, and 15, 1977, hearing was held in Baltimore, Maryland, pursuant to which the following findings of fact and conclusions of law were published in a decision and order of July 13, 1978:

## FINDINGS OF FACT

1. The Secretary and the Commission have jurisdiction over the Respondent's Sparrows Point facility.

2. An investigation was conducted on April 28, 1977.

3. Dennis Hancock, an employee of Respondent, was working in a unit containing 239.768 cubic feet of air space and it must be concluded was a confined space.

4. Dennis Hancock was wearing a 1200 Wilson Respirator.

5. Air samples were taken while fastened to Dennis Hancock showing 5.3 $mg/M^3$ concentration of fluorides during his welding work.

6. Two coppus blowers were used by Hancock during the day of April 28, 1977.

7. There was fresh air furnished by a 10-inch metal tube from a blower which had a 14,000 cubic-foot-per-minute capacity in the passageway of the unit occupied by Hancock.

8. Hancock discharged a black substance from his nose after a day of welding in a small space.

9. Fluorides were present in the welding rods used by Hancock and such fluorides were released into the air during the welding process exceeding 2.5 $mg/M^3$.

10. The sampling by Complainant was in compliance with standards established for that procedure for determination of air contaminants. It must be concluded that the cassette on Dennis Hancock was near his breathing zone during the time he was welding.

11. Complainant did not prove that Hancock or other employees were without personal protective equipment. On the contrary it was shown that Wilson respirators were provided by Respondent and worn by the employees.

12. Motion to impose sanctions merits no useful purpose and should be denied. It appears that a ministerial mistake was made by Respondent and compounded by a member of the Union.

## CONCLUSIONS OF LAW

1. Provisions of the Act were applicable to Respondent.

2. The air contaminants of fluorides exceed the permissible limits of 29 C.F.R. 1910.1000, to wit, 2.5 $mg/M^3$ in that they were 5.3 $mg/M^3$.

3. Dennis Hancock was working in a confined space without adequate exhaust ventilation to remove fluorides produced by welding rods during a welding procedure.

4. Sufficient ventilation was not provided to ventilate hazardous fluorides during welding which utilized welding rods containing fluorine compounds, thereby permitting airborne concentration of fluorides to attain 5.3 $mg/M^3$.

5. Respondent violated 29 C.F.R. 1910.1000(a)(2).

6. Respondent violated 29 C.F.R. 1910.252(f)(4) and (f)(5).

7. Respondent violated 29 C.F.R. 1916.31(a) and (b).

8. The size of Respondent, and the number of employees require a penalty of $700.

The subsequent ORDER, affirmed the Citation (as amended), and assessed a penalty of $700. The amendment to the Citation alleging a violation of 29 CFR 1916.57(e) was vacated.

Respondent filed a petition for discretionary review before the Review Commission. The petition was denied and the aforementioned decision became a final order of the Review Commission August 14, 1978.

Thereafter, Respondent filed an appeal before the United States Court of Appeals for the Third Circuit on October 13, 1978. The Court in its decision dated October 24, 1979 (Bethlehem Steel Corp. v. OSHRC, 607 F.2d 1071, (3rd Cir., 1979)) remanded the case to the Review Commisison for further findings consistent with that opinion.

The Court made two holdings which must be clarified on remand. In its first holding the court stated, "In view of OSHRC's withdrawal of the charge under section 1910.1000(a)(2) we vacate that portion of the ALJ's order holding Bethlehem to be in violation of it." (Bethelehem, supra, at 1072).

The Court's error is transparent at first blush when one understands OSHRC does not have the power under the Act to "withdraw" items of a citation. Under section 10(c) of the Act, after a citation is contested, the Commission is empowered only to affirm, modify, or vacate the Secretary's citation, or proposed penalty (See, 29 U.S.C. § 659(c)). In the instant situation there was no order issued vacating the relevant part of the Secretary's citation. 29 CFR 1910.1000(a)(2) was therefore clearly still in contest, and I made specific findings it had been violated.

The confusion over this issue arose due to faulty draftmanship on Complainant's part. The supposed vacation took place upon my granting of Complainant's motion to amend the citation. In a long, conversational, unspecific, and ambiguous motion, Complainant, in relevant part, prays:

> Moreover, Paragraph VII of the Complaint should be amended to read as follows:
>
> > Paragraphs V and VI of the Complaint amend the Citation pursuant ot 29 CFR 2200.33(a)(3) to describe the violative conditions with greater specificity, add an allegation of violation of 29 CFR 1910.252(f)(4) and (5) to the Citation, and to allege in the alternative violations of applicable Maritime Standards contained in 29 CFR Part 1916.
>
> As grounds for this Motion, Complainant represents that 29 CFR 1910.5(c) requires that if a particular standard is specifically applicable to a condition, practice, means, method, operation, or process, it shall prevail over any different general standard which might otherwise be applicable.
>
> Since 29 CFR 1910.252(f)(4) and (f)(5) are standards which deal with the specific operations involved in this case, e.g., welding with material containing flouride fluxes, it is appropriate to charge a violation of the aforesaid standards rather than the standard of general application, 29 CFR 1910.1000.

Nowhere does Complainant specifically request vacation of any item concerning 29 CFR 1910.1000. "Vacation" is a term of art in the legal profession insofar as the Occupational Safety and Health Act is concerned. I was considering a motion to amend, not a motion to vacate. I did not sua sponte (as the Circuit Court's decision implies) vacate the citation. As explained fully in my original decision and order, I granted the motion to amend, and treated it as a request to proceed in the alternative. As previously discussed, when presented with the charge in the alternative I made specific findings that 29 CFR 1910.1000(a)(2) had been violated. As the Circuit Court did not controvert those findings the portion of my decision erroneously vacated by the Circuit Court should have been Affirmed.

The Circuit Court of Appeals made another holding which requires attention in this opinion. The court held, "Our threshold inquiry must be whether Bethlehem's alleged noncompliance may be deemed 'serious' for we need not reach the question of whether the substantive requirements of the standards were violated if such violations may not be characterized as serious." (Supra, at 1072 and 1073). While I will more fully discuss the seriousness issue infra, it should be noted the court has misstated the well established rule of law followed by the Commission and reviewing courts, and mandated by legislative history. The first question faced by the trial judge is whether a violation existed, and if so, what classification is appropriate. The judge's power to reclassify citations to include violations of lesser magnitude is derived from section 10(c) of the Act.[1/] This duty has also been confirmed by the Commision in Secretary of Labor v. Toler Excavating Company, OSHRC Docket No. 2637 BNA 3 OSHC 1421 (1975). In Toler, the Commision stated, ". . . Congress intended that these terms [willful, serious and nonserious] be of primary significance on penalty matters and that the failure of a citation to so

1/ As cited supra, section 10(c) requires the Commisison to affirm, vacate or modify all citations.

classify a violation would not in itself constitute a flaw so fatal as to invalidate the violation. See also Staff of the Senate Comm. on Labor and Public Welfare, 92d Cong., 1st Sess., Legislative History of the Occupational Safety and Health Act of 1970, at 856." (Supra, at 1421).

However, this fact does not resolve the reviewing court's underlying doubts concerning the seriousness of the violation. The court found, "examination of the ALJ's decision reveals that absolutely no findings were made with respect to the alleged seriousness of the violation. The ALJ simply concluded the violation was serious." (Bethlehem, supra, at 1073). In its order of remand the court directed I, "consider whether Hancock's activities prior to the date of inspection may have warranted a finding that the conduct in issue constituted a serious violation. . ." (Supra, at 1074). In doing so the court seems to have accepted Bethlehem's assertion that the hazard must present a probability that death or serious bodily injury could result. This is not the law under the Act, an injury need only be possible (i.e., there need only be employee exposure to the hazard). The remand order was issued to decide the question of whether Hancock's single exposure was sufficient to establish a serious violation. The law on this issue is clear. In Secretary of Labor v. Scullin Steel Company, OSHRC Docket No. 13916, OSHD ¶ 22,835 (1978), the Commission reviewed a case of one time exposure to fluorides under 29 CFR 1910.1000(a)(2). The Commission ruled "Respondent challenges the accuracy of the time of exposure used in the compliance officer's calculations. It suffices to note, however, that exposure to the fluoride concentrations during only the 67 minute sampling is prohibited by the standard" [emphasis added]. In Scullin, the Commission affirmed a Notification of Penalty for failure to abate based on a previous uncontested final order. The Commission affirmed a penalty of $1,060. There is no room for doubt that a single exposure to excessive fluoride levels can be the basis for a violation.

The question of seriousness arises when an accident could possibly occur. An accident need not occur for a violation to exist. (Brennan v. Butler Lime and Cement Company, 520 F.2d 1011 (7th Cir., 1975)). The Review Commission has delineated this distinction and the policies underlying it in Secretary of Labor v. Standard Glass and Supply Company, OSHRC Docket No. 585, BNA 1 OSHC 1225 (1973). There the Commission explained:

> It is our view that substantial probability that death or serious physical injury could result, in conjunction with the knowledge of requirement of section 17(k) and the possibility of an accident's occurrence, is all that is required for a violation to be considered serious. The occurrence of an accident because of an existing hazard in violation of the Act need not be substantially probable in order for a violation to be serious, within the meaning of the Act. (Emphasis supplied)

Section 17(k) reads as follows:

> For purposes of this section, a serious violation shall be deemed to exist in a place of employment if there is a substantial probability that death or serious physical harm could result from a condition which exists, or from one or more practices, means, methods, operations, or processes which have been adopted or are in use, in such place of employment unless the employer did not, and could not with the exercise of reasonable diligence, know of the presence of the violation. (Emphasis supplied)

> Serious and non-serious violations are distinguished on the basis of the seriousness of injuries which experience has shown are reasonably likely to result when an accident does arise from a particular set of circumstances. Section 13(a) of the Act provides that the Secretary may petition to restrain conditions which ". . . could reasonably be expected to cause death or serious physical harm immediately. . ." [Emphasis added]. Providing for an additional means of enforcement for conditions which constitute imminent dangers distinguishes section 13 violations from those of section 17(k). The difference is the immediacy of the danger. Similarly, serious and non-serious violations are differentiated on the basis of the degree of probable injury. [footnote omitted]. These

> violations are defined primarily to provide appropriate means of enforcement. Imminent dangers may be restrained. Serious violations, unlike non-serious ones, warrant mandatory penalties. Thus, by reading these sections of the Act together, a rational distinction among the three types of violations is revealed. To require, in addition, that for serious violations the occurrence of accidents be substantially probable is inconsistent with the logical progression of violations and their concomitant remedies. That interpretation would make serious violations and those constituting imminent dangers practically indistinguishable.

Therefore, it is evident from the above that there was no necessity of a finding that serious injury was probable. It need only be found that if an accident were to occur, the result would probably be a serious injury. Further, the Review Commission has emphasized the brevity of exposure does not negate a finding of a violation (Secretary of Labor v. Stahr and Gregory Roofing Company, Inc., OSHRC Docket No. 76-88, BNA 7 OSHC 1010 (1979)). While no finding in my decision of July 13, 1978 states Respondent knowingly placed employee Dennis Hancock in a position where exposure to flourides could produce death or serious physical injury, this could easily be derived from the findings which were made. Indeed, the court in Bethlehem, stated "Fluoride contaminants can be highly toxic and prolonged exposure to excessive levels of fluorides may result in serious injury, even death." (Supra, at 1071). Any excessive exposure to fluorides is dangerous, as the Review Commission stated in Scullin Steel Co., supra, prolonged exposure is irrelevant. The evidenciary basis for this finding is taken from the testimony of Complainant's expert witness, Dr. Lorné Houten.

In testifying concerning the hazards presented by fluoride exposure, Dr. Houten stated:

> A Well, hydrogen fluoride gas is a corrosive substance, related to - a better known substance to which it is closely related is hydrochloric acid. It has many of the same corrosive properties.

Q Now, talking about particularate flouride, could you tell us what the hazards of worker exposure to particulare fluoride?

A Exposure to fluorides in general, and particulate fluorides inhaled in particular, can affect many of the organ systems in the body.

The effects can be both acute and chronic. The acute effects can occur to the respiratory system, with shortness of breath, burning of the nasal passages and buccal cavity, cough. They can affect the gastrointestinal tract, producing vomiting, diarrhea, abdomonal cramps. The vomiting and diarrhea occasionally can be bloody.

It can affect acutely the neurological system, causing headache, faintness. And there is a series of other symptoms which can occur occasionally upon acute exposure to fluorides.

(Tr. 398).

Dr. Houten went on to describe the chronic effects that short term exposure could produce:

THE WITNESS: The chronic effects of exposure again can apply to several of the bodily systems. The most prominent effects are to the skeletal system. Fluorides will replace other substances from the hydroxy-appetite matrix, which comprises much of the bone and teeth, forming a fluoride-type matrix.

It can have an affect on dentition, causing an effect known as mottling. It can have an effect on the skeleton, causing a hyperplasia, or increased growth of many of the bone elements, particularly of the spine, particularly in the areas of muscular attachments and ligament attachments, as well as in the interosseus spaces, or the joint areas. And this can have – and this has had, in severe cases – crippling effects on persons exposed to fluorides.

(Tr. 399–400).

On cross-examination, Dr. Houten opined that levels below those set in the standard could produce serious chronic effects (Tr. 406). As found in my earlier decision, Respondent's operations significantly exceeded the allowable levels of the

standard (findings Nos. 4, 9). The standard allows for permissible level of 2.5 mg/$M^3$, Respondent's operation produced concentrations of 5.3 mg/$M^3$. These findings together with Dr. Houten's testimony make a finding of serious violation imperative.

It cannot be reiterated too strongly that Respondent knew of the conditions present. They placed their employee in a position where he was exposed to a hazard which could have produced death or serious physical illness. Hancock was an employee of Respondent whose regular course of employment as a welder exposed him to a possibility of serious injury, as defined under the Act. While the evidence does not reveal if this exposure was often repeated, as stated above, this is irrelevant to a finding of a serious violation. However, it may be assumed that as welding was Hancock's normal job function, and Respondent's shipbuilding facilities could require welding in confined spaces; it could then be assumed he and other employees were repeatedly exposed to the cited hazards.

In view of the findings of fact adduced in my decision of July 13, 1978, and of the evidence recounted above, it must be concluded Respondent violated the Act in a serious manner, by knowingly placing an employee in a zone of danger created by exposure to 5.3 mg/$M^3$ of dangerous fluorides. All other findings of fact and conclusions of law announced in Bethelehem Steel Corporation, OSHRC Docket No. 77-1807 (July 13, 1978) are adopted and incorporated herein by reference.

As to the Complainant's proposed penalty of $700, Bethlehem Steel Corporation is a large internationally recognized company with many employees at this location, and at sites throughout the country. Respondent has demonstrated good faith at this hearing, however has a history of prior violations of the Act at their Sparrow's Point Yard. The gravity of this violation was found to be serious. For the foregoing reasons the penalty of $700 proposed by Complianant is appropriate.

## SUPPLEMENTAL FINDINGS OF FACT

1. Respondent had knowledge or with the exercise of reasonable diligence should have had knowledge of the conditions present in that they assigned an employee, whose normal job function was welding, to work in a confined space without adequate ventilation where the flouride levels exeeded those permitted by regulation.

2. As testified to by Dr. Lorne Houten, exposure to excessive levels of fluorides may acutely affect the respiratory, gastrointestinal, and neurological systems causing serious physical harm such as shortness of breath, burning of the nasal passages and buccal cavity, coughing, vomiting, diarrhea, abdominal cramps, headaches and faintness.

3. As testified to by Dr. Houten, short term exposure to flourides may cause chronic serious physical effects on dentition and the skeletal system. This can cause increased growth of many of the bone elements with possible crippling effects on those exposed to the flourides.

4. Considering the requirements of 17(j) of the Act, including Respondent's size, history, number of employees and the gravity of the violation, the $700 penalty proposed by Complainant is appropriate.

## SUPPLEMENTAL CONCLUSIONS OF LAW

1. Complainant correctly classified the violation as serious, as defined in section 17(k) of the Act, in that Respondent placed an employee in a position where he was exposed to a hazard where there was a substantial probability death or serious physical harm could result, and Respondent knew of, or with the exercise of reasonable diligence, should have known of the conditions.

## ORDER

1. Citation No. 1 charging a violation of 29 CFR 1910.252(f)(4) and (f)(5); and 29 CFR 1916.31(a) and (b) are affirmed.

2. Respondent is assessed a penalty of $700.

DECISION

Before: ROWLAND, Chairman; CLEARY and COTTINE, Commissioners.

BY THE COMMISSION:

The primary issue in this case is whether compliance with the machine guarding standards at 29 C.F.R. § 1910.212 is required during inspection, cleaning and maintenance of a powder compacting press. Administrative Law Judge Henry F. Martin, Jr., held that section 1910.212 is inapplicable during these operations, and vacated a citation alleging that Respondent, General Electric Company ("GE"), had willfully failed to comply with either sections 1910.212(a)(1) or 1910.212(a)(3)(ii). 1/ He also found that the Secretary of Labor failed to establish a violation

---

1/ Section 1910.212(a) states in part:

> §1910.212 General requirements for all machines.
> (a) Machine guarding -- (1) Types of guarding. One or more methods of machine guarding shall be provided to protect the operator and other employees in the machine area from hazards such as those created by point of operation, ingoing nip points, rotating parts, flying chips and sparks. Examples of guarding methods are--barrier guards, two-hand tripping devices, electronic safety devices, etc.
>
> (3) Point of operation guarding.
> (i) Point of operation is the area on a machine where work is actually performed upon the material being processed.
> (ii) The point of operation of machines whose operation
> . . .

(cont'd)

of 29 U.S.C. § 654(a)(1), section 5(a)(1) of the Occupational Safety and Health Act of 1970, 29 U.S.C. §§ 651-678 ("the Act"). The Secretary sought discretionary review; Commissioner Cleary directed review under section 12(j) of the Act, 29 U.S.C. § 661(i), on the issues raised by the petition, including:

> 1. Whether the administrative law judge erred in vacating a complaint alleging that an employee of General Electric Company used a machine the point of operation of which was not guarded as required by the standard at either 29 CFR §1910.212(a)(1) or 29 CFR §1910.212(a)(3)(ii) on the ground that compliance was not required because the employee was performing maintenance, not operating the machine; and
>
> 2. Whether the administrative law judge erred in vacating the complaint alleging a violation of section 5(a)(1) . . . on the grounds that General Electric Company did not have knowledge of the alleged hazard and that the alleged violation was caused by an employee's failure to take available and known precautions to prevent creation of the alleged hazard.

We reverse Judge Martin's decision.

I

GE manufactures tungsten carbide products at its plant in Houston, Texas. An initial step in this process is the compression of metallic powder into puck-shaped cakes. Two Baldwin-Lima-Hamilton compacting presses are used to produce the cakes. The presses are operated from a control panel with many buttons. To activate the rams, three power buttons (the master power switch, the oil pump switch, and the drive motor switch) are engaged, and then the "start cycle" switch is engaged. A switch operated by a key ("the press selector switch") allows the

---

(Footnote 1 cont'd)

> exposes an employee to injury, shall be guarded. The guarding device shall be in conformity with any appropriate standards therefor, or, in the absence of applicable specific standards, shall be so designed and constructed as to prevent the operator from having any part of his body in the danger zone during the operating cycle.

operator to choose between a run (production) mode and a jog mode. The jog mode permits the operator to "inch" the rams, and is selected by turning the key of the press selector switch. In the jog mode, the rams may be advanced to a specific position for inspection and maintenance by depressing two "inch" buttons on the control panel. In the run mode the press runs at constant speed. The press is designed to operate in the run mode only when a metal guard surrounding the point of operation is in place and pressing on a microswitch. The guard must be removed to clean the machine, to inspect the molds on the ram and to replace the molds. When the guard is removed, the microswitch, which is nine inches from the rams, is released and the power is shut off. To start the press after the guard has been removed, the power buttons must be turned on, and the microswitch manually pressed down. If the power buttons are left in the "on" position, and the press selector switch is in the run position, the press will start up as soon as the microswitch is pressed down.

At the time of the inspection, the cited press could not be operated in the jog mode in the usual way because the key for the press selector switch was broken off in the run position. The inch buttons therefore could not be used. There were, however, two additional ways to jog the press' rams. One method involved turning the "start cycle" switch on and off in rapid succession in order to start and stop the production cycle. The second method involved starting the press, removing the guard, and depressing the microswitch intermittently.

On September 16, 1977, the operator of the press, Linn, was shown what was suspected to be a broken piece of mold. The press had been stopped and Linn removed the guard in order to check the mold, which is attached to the rams. Linn engaged the power buttons, and then jogged the ram with the microswitch in order to align the bottom ram in a suitable position for inspection. Linn then reached in between the rams to check the bottom mold. Linn stated that as he

was removing his hand, he must have brushed the microswitch; the press jogged and crushed three of his fingers. 2/

Judge Martin vacated the citation. He found that the press was adequately guarded during its production cycle and, citing Jersey Steel Drum Manufacturing Corp., 75 OSAHRC 36/E9, 2 BNA OSHC 1663, 1974-75 CCH OSHD ¶ 19,392 (No. 1119, 1975), held that the cited machine guarding standards were inapplicable during cleaning or maintenance operations. The judge found that cleaning and maintenance could not be accomplished without removing the guard, and that no evidence had been presented to show that a guard could be installed that would have permitted the press operator to inspect the mold. The judge also found that Linn was aware of company safety rules, which required the press operator to shut the power off during cleaning operations, and that Linn had instructed several other press operators to observe the power-off rule. Judge Martin found that GE had no knowledge of the broken key in the press selector switch, and had no reason to anticipate that Linn would disobey the safety rule by placing his hand in the mold while the power was on.

On review, GE maintains that it did not violate either of the cited machine guarding standards. It claims these standards apply only to points of operation, and that the definition of point of operation indicates that a point of operation does not exist during inspection, cleaning or maintenance. 3/ GE also argues that it adequately provided for employee safety during cleaning and inspections

---

2/ Linn testified that he pressed the off button on the control panel and then tested the microswitch to be certain that the power was off. The judge disbelieved that testimony.

3/ Although GE relies upon the definition in section 1910.211(d)(45), that definition pertains only to terms used in section 1910.217, which was not cited here. We shall consider GE's argument with respect to the similar definition in section 1910.212(a)(3)(i), however.

by providing "power-off" switches. It contends that the Secretary's interpretation of the machine guarding standards would make cleaning and maintenance impossible, because under that interpretation the guards could not be removed. GE also points to testimony by the compliance officer that GE's safety rules met OSHA requirements.

The Secretary contends that the Commission should adopt the rationale suggested by the dissenting opinion in Jersey Steel Drum, and apply section 1910.212 to maintenance and inspection because those functions are frequently performed on the powder press and constitute an integral part of GE's production operation. The Secretary claims that a point-of-operation hazard existed in that the broken press selector switch made it necessary for the operator to remove the guard in order to jog the press' rams with the microswitch. The Secretary argues that sections 1910.212(a)(1) and (a)(3)(ii) should apply "whenever a machine may be operating . . . as long as the employee exposure is reasonably foreseeable."

The Secretary also argues that the judge erred in finding that GE did not know that the press selector switch was broken, given the employees' testimony to the contrary. The Secretary maintains that, because the microswitch was frequently used to jog the press, GE could have known of the broken key with the exercise of reasonable diligence. The Secretary argues that GE's efforts to ensure the observance of safe work practices were minimal, and that GE therefore cannot argue that it did not know of the press' condition.

II

In Jersey Steel Drum, the Commission considered whether section 1910.212(a)(1) applied during maintenance of a drum hoop expander, but that decision contained no majority rationale. Only one member, former Commissioner Moran, found that section 1910.212(a)(1) was not designed to cover maintenance work. Former

Commissioner Van Namee concurred on another ground. Commissioner Cleary dissented on the ground that section 1910.212(a)(1) was intended to protect all employees exposed to machine hazards, including machine hazards arising during maintenance. He emphasized that standards should be construed consistently with the statutory objective of assuring "so far as possible every working man and woman in the Nation safe and healthful working conditions." Section 2(b) of the Act, 29 U.S.C. § 651.

We hold that section 1910.212 applies to machine hazards that arise during inspection, cleaning, and maintenance. We do so primarily because section 1910.212 establishes requirements for the protection of operators and other employees in the machine area from hazards without regard to whether such hazards are created during production or non-production operations. Section 1910.212 does not employ the terms "production" or "maintenance" or otherwise distinguish between production and maintenance. As the facts of this case clearly demonstrate, if a machine is activated during maintenance and commences its operating cycle, the operator can be exposed to injury in the same manner and degree as he can during ordinary production; the operating characteristics of this press were also not materially changed by the maintenance being performed. Therefore, in the absence of an express exclusion for maintenance activities, or other clear evidence of contrary intent, and in view of the standard's and the Act's remedial, protective purpose, we will not imply an exception to section 1910.212 that deprives employees of its protection. See Hughes Brothers, Inc., 78 OSAHRC 65/A2, 6 BNA OSHC 1830, 1833, 1978 CCH OSHD ¶ 22,909, p. 27,717 (No. 12523, 1978).

GE was cited in the alternative under section 1910.212(a)(1) and under section 1910.212(a)(3)(ii), the point of operation standard. We observe initially that, contrary to GE's argument, this case presents a point of operation guarding

problem. Section 1910.212(a)(3)(i) defines "point of operation" as "the area on a machine where work is actually performed upon the material being processed." This provision identifies, in our view, only the location on a machine that is to be considered a point of operation and not, as GE suggests, the occasions when a point of operation exists. See Dayton Tire & Rubber Co., 80 OSAHRC 95/D4, 8 BNA OSHC 2086, 2089, 1980 CCH OSHD ¶ 24,842, p. 30,636 (No. 16188, 1980); Boonville Division of Ethan Allen, 78 OSAHRC 105/B4, 6 BNA OSHC 2169, 2171, 1979 CCH OSHD ¶ 23,219, p. 28,078 (No. 76-2419, 1978)(similar definitional section). Indeed, a contrary construction would lead to the absurd result that the point of operation appears and disappears as the material worked on is fed into and removed, even though the point-of-operation hazard is always present.

Both sections 1910.212(a)(1) and 1910.212(a)(3)(ii) address themselves to the hazard of an unguarded point of operation. Section 1910.212(a)(1) is a broader standard. It speaks of protecting "the operator . . . from hazards such as those created by point of operation," as well as other machine hazards. Section 1910.212(a)(3)(ii), by contrast, specifically addresses point of operation guarding. Inasmuch as the cited powder press posed a point of operation hazard, it appears that both standards apply, and were properly cited. Because this case concerns only a lack of point of operation guarding, and because it would be duplicative to find violations of both standards, we shall only apply section 1910.212(a)(3)(ii). 4/

It is undisputed that the guard was removed during the maintenance operation, exposing the press operator to the unguarded point of operation. It is also

---

4/ Because we find that a specific standard applies, citation to section 5(a)(1) of the Act is inappropriate. Mississippi Power & Light Co., 79 OSAHRC 109/D12, 7 BNA OSHC 2036, 2041, 1980 CCH OSHD ¶ 24,146, p. 29,342 (No. 76-2044, 1979). We therefore need not consider the Secretary's alternative allegation that GE violated section 5(a)(1).

established that, if the operator failed to shut the power off after the guard was removed, the rams could be activated by pressing the microswitch. Yet the only protection that GE provided the operator on those occasions when he was required to reach into the point of operation was a work rule that required the press' power to be shut off. Section 1910.212(a)(3)(ii), however, requires the employer to do more than merely establishing rules which, if followed, would render the work safe. The standard requires a "guarding device" to "prevent the operator from having any part of his body in the danger zone during the operating cycle." It rejects reliance upon the skill or attentiveness of employees, see Hughes Bros., 6 BNA OSHC at 1832, 1978 CCH OSHD at p. 27,716, and instead requires physical guarding methods that do not depend for their effectiveness on correct employee behavior. Columbian Art Works, Inc., 81 OSAHRC 96/F5, 10 BNA OSHC 1132, 1133 n.2, 1981 CCH OSHD ¶ 25,737, p. 32,102 n.2 (No. 78-29, 1981), and cases cited therein; H.B. Zachry Company, 80 OSAHRC 69/A2, 8 BNA OSHC 1669, 1674-5, 80 CCH OSHD ¶ 24,588, p. 30,166 (No. 76-2617, 1980); Pass & Seymour, Inc., 79 OSAHRC 101/C13, 7 BNA OSHC 1961, 1963, 1979 CCH OSHD ¶ 24,074, p. 29,238 (No. 76-4520, 1979)("standard is intended to protect against injury resulting from an instance of inattention or bad judgment"). Therefore, we find that GE did not comply with section 1910.212(a)(3)(ii).

We emphasize that the allegedly improper work practice of GE's press operator does not constitute the basis for our finding of noncompliance. The critical question in this case is not whether GE's workrule was followed, but whether GE had the guarding device required by section 1910.212(a)(3)(ii). The press operator's failure to obey GE's workrule, if indeed there was a failure, is therefore irrelevant.

We now examine whether the defense of impossibility of compliance has been established. In order to establish the impossibility defense, the employer must

prove that: (1) compliance with the requirements of the cited standard either would be functionally impossible or would preclude performance of required work, and (2) alternative means of employee protection are unavailable. M.J. Lee Construction Co., 79 OSAHRC 12/A2, 7 BNA OSHC 1140, 1144, 1979 CCH OSHD ¶ 23,330, p. 28,227 (No. 15094, 1979). We find that the first element of the defense has not been established. Although the barrier guard that GE used during production could not be used during maintenance, GE presented no evidence that other guarding devices, such as the two-hand tripping devices and electronic safety devices mentioned in section 1910.212(a)(1), could not have been used to protect its employee. See F.H. Lawson Co., 80 OSAHRC 19/A14, 8 BNA OSHC 1063, 1066-7, 1980 CCH OSHD ¶ 24,277, p. 29,574-5 (No. 12883, 1980). We also note that shortly after the accident involving the powder press, GE rewired the press' microswitch in such a way that the press could not be jogged with it. After the rewiring, the power automatically shuts off when the guard is removed, and the press cannot be cycled until the guard is replaced and the starting sequence repeated. These facts rebut GE's contention that guarding is impossible during maintenance.

We now turn to the questions of the proper classification of the violation and the assessment of an appropriate penalty. GE was originally cited for a willful violation. A violation is willful if it was committed with either an intentional disregard of the requirements of the Act or a plain indifference to them. Mel Jarvis Construction Co., 81 OSAHRC 89/B13, 10 BNA OSHC 1052, 1053, 1981 CCH OSHD ¶ 25,713, p. 32,060 (No. 77-2100, 1981). Because the judge vacated the citation, he did not resolve the willfulness question. In the interests of adjudicative efficiency, the Commission will make the necessary determinations itself instead of remanding. See Accu-Namics, Inc., 74 OSAHRC 35/A2, 1 BNA OSHC 1751, 1756, 1973-74 CCH OSHD ¶ 17,936, p. 22,234 (No. 477, 1974), aff'd, 515 F.2d 828 (5th Cir. 1975), cert. denied, 425 U.S. 903 (1976).

The record before us does not demonstrate that GE acted with either intentional disregard of or plain indifference to the requirements of the Act. GE

had supplied the powder press with a barrier guard. If the guard were removed, power to the press would have automatically shut off. It also had a workrule which was intended to protect the operator. There is no evidence GE believed that the Act and the standards required more than what it provided. On the whole, we cannot say that GE disregarded or was plainly indifferent to the requirements of the Act. Accordingly, the willful characterization is vacated.

Where a violation is alleged to be willful but is not proved to be so, a serious violation may be found if the parties have expressly or impliedly consented to try the issue of whether the violation was serious. Toler Excavating Co., 75 OSAHRC 76/C8, 3 BNA OSHC 1420, 1975-76 CCH OSHD ¶ 19,875, 1975). At the hearing, the compliance officer testified without objection that exposure to the unguarded point of operation posed a serious risk of injury. Also, the Secretary requested in his briefs to the judge and the Commission, and in his petition for discretionary review, that the violation be characterized as serious. The judge found that although the violation was pleaded to be willful, "it has been treated throughout the hearing as a willful[-]serious violation." GE has not objected to the Secretary's request. We therefore conclude that the parties tried the seriousness of the violation, and we amend the pleadings accordingly.

We find that the violation was serious within the meaning of section 17(k) of the Act, 29 U.S.C. § 666(j). 5/ The facts of this case demonstrate beyond

---

5/ Section 17(k) of the Act states:

> For purposes of this section, a serious violation shall be deemed to exist in a place of employment if there is a substantial probability that death or serious physical harm could result from a condition which exists, or from one or more practices, means, methods, operations, or processes which have been adopted or are in use, in such place of employment unless the employer did not, and could not with the exercise of reasonable diligence, know of the presence of the violation.

question that, if an accident occurred, it would be substantially probable that death or serious physical harm would result.

We now consider what penalty would be appropriate under these circumstances. In assessing a penalty, the relevant factors set forth in section 17(j) of the Act, 29 U.S.C. § 666(i), are the gravity of the violation and the employer's size, good faith, and history of previous violations.

The Secretary introduced evidence at the hearing that GE employed 286,000 persons and held assets valued in the billions of dollars. GE demonstrated a good faith concern for employee safety by immediately remedying the hazard, and by issuing workrules in an effort to achieve a safer workplace. The gravity of the violation is moderate to high, considering the number of employees exposed to this press and the potential severity of an injury. Taking these factors together, we consider a penalty of $500 to be appropriate.

Accordingly, the judge's decision is reversed. Citation No. 2 is affirmed; the violation is found to be serious but not willful. A $500 penalty is assessed.

SO ORDERED.

FOR THE COMMISSION

Ray H. Darling, Jr.

Ray H. Darling, Jr.
Executive Secretary

DATED: MAY 28 1982

ROWLAND, Chairman, dissenting,

I dissent from the majority's conclusion that GE committed a serious violation of section 1910.212(a)(3)(ii). In my view, neither section 1910.212(a)(3)(ii) nor the alternatively cited standard, section 1910.212(a)(1), applies to the inspection, cleaning, and maintenance of GE's powder press. I further conclude that Judge Martin correctly vacated the alternatively alleged violation of section 5(a)(1) of the Act.

It is well settled that a standard is to be given a reasonable interpretation which reflects the plain meaning of its terms. Usery v. Kennecott Copper Corp., 577 F.2d 1113 (10th Cir. 1977); Diamond Roofing Co. v. OSHRC, 528 F.2d 645 (5th Cir. 1976); Arkansas Rice Growers Cooperative Association, 10 BNA OSHC 1616 (No. 77-3974, 1982); Berglund-Cherne General Contractors, No. 79-4347 (Apr. 30, 1982). Consistent with this principle, a standard cannot be construed to mean what the drafters may have intended but did not express. E.g., Arkansas Rice Growers, supra, citing Diamond Roofing, supra.

Section 1910.212(a)(3)(ii) provides:

> The point of operation of machines whose operation exposes an employee to injury, shall be guarded. The guarding device shall . . . be so designed and constructed as to prevent the operator from having any part of his body in the danger zone during the operating cycle.

(Emphasis added.) As commonly understood, the words "operation" and "operating" mean functioning, producing and working. 6/ The terms are not commonly understood to connote inspection, cleaning, or maintenance procedures. Significantly,

---

6/ Webster's Third New International Dictionary (1971) lists "functional" as a synonym for "operating" and defines "operating" as "engaged in some form of operation. . .esp: engaged in active business (as manufacture. . .)" "Operation" is described as "the quality or state of being functional or operative". ("Operative" is in turn defined as "engaged in doing work: occupied in productive labor: working.") Similarly, The American Heritage Dictionary of the English Language (1976) defines "operation" as "the state of being operative or functioning" and "a process or method of productive activity."

no reference to maintenance is made in the cited standard. See Bethlehem Steel Corp. v. OSHRC, 573 F.2d 157 (3d Cir. 1978) (standards cannot be interpreted to mean what the drafters did not express). Therefore, the plain meaning of the language in section 1910.212(a)(3)(ii) suggests that the standard applies only during the production cycle, not during the maintenance process. 7/

Moreover, maintenance activities are substantially dissimilar from normal operations because during maintenance, employees are often required to remove the guard and enter the point of operation. Indeed, as the Secretary and the majority concede, GE's employees could not clean, inspect, or repair the broken mold with the barrier guard in place. Since conditions during inspection, cleaning, and maintenance are so unlike those during normal production, I conclude that the drafters of section 1910.212(a)(3)(ii) did not intend for the standard to apply to maintenance. See Ormet Corp., 81 OSAHRC 35/C3, 9 BNA OSHC 1828, 1831, 1981 CCH OSHD ¶ 25,322, p. 31,381-3 (No. 76-4398, 1981) (difficulty of compliance considered in interpreting standard); American Can Co., 82 OSAHRC 5/A2, 10 BNA OSHC 1305, 1310, 1982 CCH OSHD ¶ 25,899, p. 32,413 (No. 76-5162, 1982) (same).

The gravamen of the Secretary's case is not the failure to guard the point of operation but the failure to de-activate the power during maintenance. Yet the plain meaning of the standard at section 1910.212(a)(3)(ii) does not indicate that the standard is intended to encompass a power de-activation requirement. See former Commissioner Van Namee's observations on locking-out in

---

7/ While I agree with the majority that the definition of "point of operation" in section 1910.212(a)(3)(i) only identifies the location of the point of operation, which does not appear and disappear as material is fed and removed, I conclude that the terms of the cited standard - section 1910.212 (a)(3)(ii) - further articulate when that standard's guarding requirements apply.

Jersey Steel Drum, supra, 2 BNA OSHC at 1665, 1974-75 CCH OSHD at p. 23,155. Indeed, the Secretary has adopted standards that do require for some machines lockable main power switches, electrical de-activation, and specific measures to protect employees during maintenance. See section 1910.213(b)(5) ("positive means shall be provided for rendering...controls [of woodworking machines] inoperative while repairs or adjustments are being made...."); and sections 1910.217(b)(8)(i) & (ii) (lockable main power switch shall be provided for every power press; motor start button shall be protected against accidental operation), (d)(9)(iv) (safety blocks for dies required during adjustment or repair of dies) and (d)(9)(v) (special tools required during lubrication). 8/ If the Secretary seeks to impose a requirement on employers to electrically deactivate machines during inspection, cleaning, and maintenance, the Secretary has the means and the responsibility to do so by promulgating a specific standard. He cannot distort existing standards which by their plain meaning address different situations and encompass different requirements. See Bethlehem Steel Corp. v OSHRC, supra. 9/

---

8/ Although GE's maintenance manager referred to the machine as a "mechanical press" once during the hearing, the record does not otherwise clearly show, and GE does not claim, that this machine is a mechanical power press governed by section 1910.217.

9/ After the citation was issued in this case, the Secretary issued an advance notice of proposed rulemaking to establish a broad lockout and tagging standard, which would require "deactivation of machinery, equipment, systems or processes while installation, repair, servicing and maintenance activites are being performed..." 45 Fed. Reg. 41012 (1980). In this notice, the Secretary referred to existing lockout-related provisions; the list did not include section 1910.212(a)(3)(ii). The Secretary further explained that a new regulation was contemplated to "add new material" because existing provisions were "incomplete". Id., at 41013.

Nor do I find persuasive the majority's reliance on "the standard's and the Act's remedial, protective purpose." As the Ninth Circuit aptly stated, "mere citation to OSHA's remedial purpose...[cannot] substitute for analysis of the problem at hand." Marshall v. Anaconda Co., 596 F.2d 370, 377 n.6 (9th Cir. 1979). Moreover, the Commission is "bound to construe...regulations, not create them ourselves." Id. (emphasis in original). Since the plain meaning of section 1910.212(a)(3)(ii) indicates that the standard only applies during production, and since maintenance involves substantially different conditions, I conclude that section 1910.212(a)(3)(ii) is inapplicable during maintenance of GE's powder press. 10/ Accordingly, I would vacate the citation for an alleged violation of section 1910.212(a)(3)(ii).

I further conclude that the alternatively cited standard, section 1910.212 (a)(1), does not apply. Commission precedent holds that a citation to a general standard is inappropriate when a more specific standard directly addressess the alleged hazard. Mississippi Power & Light Co., supra; See Ladish Co., 10 BNA OSHC 1235, 1237, 1982 CCH OSHD ¶ 25,820, p. 32,281 (No. 78-1384, 1981). This case poses

---

10/ The citation, the hearing and the review briefs are directed toward two operations: 1) the "jogging" process during which the rams are positioned for inspection; 2) the maintenance, cleaning, and inspection process durwhich the molds are manually checked for breakage. The majority fails to make this distinction.

Not only would I vacate the citation alleging a violation of section 1910.212(a)(3)(ii) with respect to the maintenance process, but I would also vacate the citation with respect to the "jogging" process. Section 1910.212(a)(3)(ii) requires point of operation guards but makes no reference to "jogging" or "inching" mechanisms. Hence the standard does not cover the broken selector key associated with the "jogging" procedure. In any event, the standard only requires that guards be "designed" and "constructed" whereas the Secretary was concerned that the jogging mechanism was not properly maintained in operable condition due to the broken selector key. See Air-Kare Corp., 81 OSAHRC 98/A2, 10 BNA OSHC 1146, 1981 CCH OSHD ¶ 25,758 (No. 77-1133, 1981) (dissent).

a point of operation hazard and section 1910.212(a)(3)(ii) is the more specific standard addressing point of operation guarding. Cf. George C. Christopher & Sons, Inc., 10 BNA OSHC 1436, 1447, 1982 CCH OSHD ¶ 25,956, p. 32,534 (No. 76-647, 1982) (concurrence) (§ 1910.212(a)(3)(ii) imposes a more specific requirement than § 1910.212(a)(1) with respect to the problem posed by points of operation.) Since section 1910.212(a)(1) is therefore not specifically applicable, I conclude that Judge Martin correctly vacated the alleged violation of that standard. 11/

Because neither section 1910.212(a)(3)(ii) nor section 1910.212(a)(1) are applicable in my view, I turn now to the alternatively alleged violation of section 5(a)(1) of the Act. Having examined the evidence and accepting the judge's express credibility determinations, I conclude that Judge Martin properly vacated the citation for an alleged 5(a)(1) violation for the reasons he stated. 12/ Therefore, I would affirm Judge Martin's decision.

---

11/ I need not address the majority's contention that parties impliedly consented to try the seriousness issue, in light of my conclusion to vacate the citation.

12/ As Judge Martin noted in his decision, the 5(a)(1) charge focused on the broken selector key (which allegedly made it impossible to "jog" or de-activate the press), not the failure to guard.

For the Complainant.

Charles R. Vickery, Esq.
Houston, Texas

For the Respondent.

DECISION AND ORDER

MARTIN, Judge:

This proceeding was brought pursuant to Section 10 of the Occupational Safety and Health Act of 1970, hereinafter referred to as the Act, to contest two citations issued by the Secretary of Labor (complainant) pursuant to Section 9(a) of the Act. As a result of an inspection by complainant's representative on October 6, 1977, through October 28, 1977,

respondent was cited for failing to provide point of operation guards in connection with the operation of a Baldwin-Lima-Hamilton hydraulic powder press at its Houston plant (Carboloy Systems), located at 4435 West 12th Street.

Citation one alleged a serious violation of 29 CFR 1910.212(a)(3)(iii)[1/] because respondent did not furnish special hand-tools for the use of employees in handling, placing, and removing material from the point of operation. Citation two alleged a willful violation of 29 CFR 1910.212(a)(3)(ii)[2/] because respondent did not provide point of operation guarding of machinery to prevent employees from placing any part of their hands in the danger zone during the operating cycle. Penalties of $1,000 and $10,000 were proposed in connection with the serious and willful citations.

---

1/ 29 CFR 1910.212(a)(3)(iii) provides as follows:

> Special handtools for placing and removing material shall be such as to permit easy handling of material without the operator placing a hand in the danger zone. Such tools shall not be in lieu of other guarding required by this section, but can only be used to supplement protection provided.

2/ 29 CFR 1910.212(a)(3)(ii) provides as follows:

> The point of operation of machines whose operation exposes an employee to injury, shall be guarded. The guarding device shall be in conformity with any appropriate standards therefor, or , in the absence of applicable specific standards, shall be so designed and constructed as to prevent the operator from having any part of his body in the danger zone during the operation cycle.

Following the filing of a timely notice of contest complainant filed a complaint which was answered by respondent. After the filing of amended pleadings a formal hearing was held in Houston, Texas, on June 20 and 21, 1978. Subsequent thereto briefs were submitted by both parties.

After alleging that respondent violated the two aforementioned standards complainant filed an amendment to the willful citation to charge respondent with alternative violations of 29 CFR 1910.212(a)(1),[3/] (failure to provide one or more methods of machine guarding), and Section 5(a)(1) of the Act,[4/] (failure to provide a place of employment free from a recognized hazard). Respondent moved to dismiss the citation

---

3/ 29 CFR 1910.212(a)(1) provides as follows:

> One or more methods of machine guarding shall be provided to protect the operator and other employees in the machine area from hazards such as those created by point of operation, ingoing nip points, rotating parts, flying chips and sparks. Examples of guarding methods are - barrier guards, two-hand tripping devices, electronic safety devices, etc.

4/ Section 5(a)(1) of the Act reads as follows:

> Each employer shall furnish to each of his employees employment and a place of employment which are free from recognized hazards that are causing or are likely to cause death or serious physical harm to his employees.

and amended complaint because of the failure to comply with Section 9(c) of the Act.[5/] Respondent's motion, which was taken under advisement, is here denied.

The issues to be decided herein are whether respondent alternatively violated either 29 CFR 1910.212(a)(1), 29 CFR 1910.212(a)(3)(ii), or Section 5(a)(1) of the Act; whether a willful violation was established in connection with one of the alternative allegations; whether a serious violation of 29 CFR 1910.212(a)(3)(iii) was established; and if any violation is found, what penalty should be assessed.

The investigation by an Occupational Health and Safety Administration compliance officer, Mr. Harrison, was precipitated by an accident on September 16, 1977, when employee Linn lost a portion of three fingers while his hand was under the ram of the press,[6/] feeling for a broken chip or piece of metal in the mold. Mr. Linn testified that a fellow employee, Mr. Otto, showed him a piece of material which he thought had broken off of the mold. The press was stopped and the metal guard (see exhibits R-2(m) and R-2(t)) was removed. He testified that he pushed the on button to start the ram, then jogged the ram with the microswitch button for

---

5/ Section 9(c) of the Act reads as follows:

> No citation may be issued under this section after the expiration of six months following the occurrence of any violation.

6/ The Baldwin-Lima-Hamilton hydraulic powder press was a Model 20 Compacting Press and was also known as a 75 ton slugging press which operates automatically, making tungsten carbide cakes. It can be adjusted to pressures of one to 75 tons. The press operates in conjunction with a granulator.

for proper alignment and pushed the stop button (see exhibit R-1, labelled C) to cut off the power. He then hit the microswitch several times to be sure that the power was off. He stated that he put his hand in to find out where the chip or broken piece came from, and in removing his hand, must have accidentally hit the microswitch, resulting in the ram coming down and crushing three of his fingers. He could not account for the microswitch activating the ram when he had allegedly cut off the power to the press. Following the accident the microswitch, which was approximately nine inches away from the ram (see exhibit R-2(k)), was rewired and repositioned, and the press selector switch was repaired. The selector switch is identified by a circle on exhibit R-1.

Mr. Linn blamed his accident on the fact that the press selector switch had a key broken off, resulting in the press being locked in the automatic mode, so that it was impossible to jog the ram from the control panel. It was necessary for Mr. Linn to jog the ram into position by using the microswitch. He testified that the key had been broken off for a year or more and that he had mentioned it to his supervisors, specifically Mr. Williams and Mr. Chandler, Mr. Miller, the plant manager, as well as Mr. Carter, the union steward.

Respondent's supervisory officials testified that they were not aware of the selector key being broken off in the automatic position until after the accident occurred. Mr. Carter, the union steward, testified that Mr. Linn told him about the broken key several times and that he had mentioned the matter to Mr. Miller and Mr. Dowden, manager of

employee relations in the Houston plant when the accident occurred. Minutes of the company-union grievance committee meetings (exhibit R-10) failed to reveal any reference to a broken key in the press selector switch.

29 CFR 1910.212(a)(3)(ii)

This standard, which requires point of operation guards to protect employees from exposure to danger zones during the operating cycle, was the main thrust of complainant's case and was deemed so flagrant that respondent was charged with a willful violation and a maximum penalty was recommended by the area director. The language set forth in the citation to describe the alleged violation is as follows:

> Operators were required to remove the interlocked guard from the press when cleaning the die. The operators were required to depress the micro-switch to jog the ram of the press into position, leave the press running, and remove material, rather than use the press control panel to jog the ram of the press into position, and then cut off the power to the press before putting their hands in the point of operation. The press selector was inoperable because the key was broken off in the automatic mode, thus exposing the operators'hands to the danger zone (point of operation) when conducting the cleaning operations.

The record herein is devoid of any evidence showing that respondent failed to have a point of operation guard to protect employees from the danger zone during the operating cycle. At first blush it might appear that complainant was contending that respondent had no guard on the press. However, by reading the narrative account of the alleged

violation it is noted that respondent's employee was required to remove the interlocked guard to clean the die. Exhibits R-2(m) and R-2(h) show the guard in place on the press and exhibits R-2(s) and R-2(t) show the guard after its removal. It should be noted that the compacting press is a fully automatic machine and is always operated with the guard in place. There is no way a person could put his hand or any part of his body in the danger zone with the metal enclosure, or guard, in place. In order to clean the area around the ram and mold it is necessary to remove the guard. Cleaning or maintenance cannot be accomplished without removing the guard (Tr. 126). This was done on the day of Mr. Linn's accident when he placed his hand in the mold to inspect or locate the place where the broken chip or piece of metal came from. When Mr. Linn performed this function the machine was not operating in its usual sense, that is, it was not automatically making cakes. The press was down for cleaning or maintenance. In other words there was no operating cycle.

Reference here made to the Commission's decision in Jersey Steel Drum Manufacturing Corp., 1974-1975 CCH OSHD ¶19,392 (March 5, 1975), wherein the Commission decided that a drum hoop expander presented no hazard to its operator during normal operations because it was adequately guarded for automatic production. In citing the Grayson Lumber Company case, 1971-1973 CCH OSHD ¶16,171 (June 14, 1973) the Commission stated:

> In the instant case it is apparent that the standard was not designed to cover maintenance work, especially since maintenance work may require the circumventing of safety guarding . . . The machine at issue

> in this case contained no point of operation since it was operated automatically. There was no hazard to employees at the 'point of operation' because employees were not needed to control the work. Since there was no 'point of operation' on this machine as that term is defined by §1910.212(a)(3)(i), we find that the citation was properly vacated for the reasons assigned by the Judge.

Point of operation is defined in 29 CFR 1910.212(a)(3)(i) as follows:

> Point of operation is the area on a machine where work is actually performed upon the material being processed.

Similiar definitions are referred to in various subsections of Subpart O entitled "Machinery and Machine Guarding," to wit, sections 211(a)(1), 211(d)(45) and 211(f)(8). Mr. Linn testified that he knew that he should have the power off when he put his hand in the mold under the ram. He admitted that a former supervisor had made him aware of this matter.

The aforementioned narrative, set forth in citation 2, states that the press selector switch, being broken off in an automatic mode, exposed the "operator's hands to the danger zone (point of operation) when conducting the cleaning operations." A careful reading of Part 1910.212 fails to mention the need for any kind of guarding when a machine is down for maintenance, cleaning or inspection. Clearly, respondent cannot be found in violation of 29 CFR 1910.212(a)(3)(ii) since an interlocked guard was specifically designed for use on this machine and this guard is always in place when the press is in its normal operating cycle.

29 CFR 1910.212(a)(3)(iii)

Respondent was charged with a serious violation because special hand-tools were not provided to keep the operator's hands out of the danger zone. This standard was promulgated to require proper hand-tools to be used to "place or remove material" from the operating zone without the operator putting his hands near the nip point or rotating parts of machinery. This standard is very similiar to 29 CFR 1910.217(c)(4), entitled "Hand feeding tools," and its intent is to require the use of tools to place and remove materials in and out of the point of operation. The descriptive language in the citation states that employees were allowed to use their hands to remove materials from the die of the powder press and were not required to use special hand-tools to place and remove materials in and out of the point of operation. The citation did not indicate what type of materials were to be placed in or removed from the point of operation.

This allegation was not established by complainant. As previously noted the machine in question operates automatically with a wire mesh guard in place and there is no way an operator could put his hand into the point of operation, nor is it possible to use any kind of tool to place materials in the processing area when the guard is in place (Tr 110, 125). Complainant's principal witness, Mr. Linn, testified that he had to use his hand to feel around the mold (see exhibit R-2(b)) to ascertain where the chip or piece of broken metal might have come from (Tr. 94). Admittedly, the press was not in an operating cycle when Mr. Linn was trying to determine whether the mold was broken or chipped (Tr. 103, 104).

Mr. Marple, a compliance officer from the regional office, testified on cross-examination that the paint brush (exhibit R-9) would be an acceptable cleaning tool if the power is locked out.

This standard does not require special hand-tools for cleaning or maintaining a press. Accordingly, it must be concluded that respondent did not fail to comply with 29 CFR 1910.212(a)(3)(iii).

29 CFR 1910.212(a)(1)

This standard, requiring one or more methods of machine guarding to protect the operator or other employees, was mentioned for the first time in an amended complaint filed some six months after the citation was issued. This failure to guard the machinery was alleged to have occurred "during cleaning operations" on the powder press. The amendment does not specifically allege in what manner the press could be guarded during cleaning operations.

No testimony was presented at the hearing to show what kind of a machine guard could have been put on the press which would have permitted Mr. Linn to inspect the ram or mold by using his hand or any hand-tool. Complainant has neglected to point out any provision or wording in Part 1910, subsection 212, which bears any relationship to the inspection, cleaning, maintenance or modification or presses. This standard suggests as guarding methods the use of barrier guards, two-hand tripping devices, and electronic safety devices. None of these devices would serve any purpose whatsoever unless the press was in an operating cycle, making

tungsten carbide discs or cakes. When Mr. Linn's hand was under the ram trying to locate a possible defect in the mold he was not concerned with flying chips, sparks or rotating parts because these hazards were not present.

It is therefore concluded that respondent did not violate the machine guarding standard set forth in 29 CFR 1910.212(a)(1).

SECTION 5(A)(1) OF THE ACT

An alleged willful violation of the "general duty" clause was one of the alternative charges raised in the amended complaint filed on June 6, 1978. It was alleged in paragraph VI(c) as follows:

> The employer failed to furnish to each of his employees employment and a place of employment free from recognized hazards causing or likely to cause death or serious physical harm to its employees in that the employer permitted employees to maintain and clean the Baldwin-Lima-Hamilton hydraulic powder press, in the powder granulate room with the selector switch broken off in the automatic mode thus making it necessary for the operator or person cleaning the machine to perform such operations without being able to use the control panel to jog the machine into cleaning position as needed and/or without being able to clean the machine with the power turned off.

It is here noted that the original concern of complainant was the alleged lack of guarding on the powder press, which was the machine on which Mr. Linn was injured. The alternative theory of resorting to the general duty clause did not surface until the amended complaint was filed.

The amendment was permitted over respondent's objection because of the descriptive language in the willful citation referring to "cleaning operations" on the press.7/

Rule 73(a) of the Commission's Rules of Procedure places the burden of proof in enforcement proceedings upon the Secretary (complainant). After reviewing all of the evidence in the record it is concluded that the key broken off in the press selector switch was not the cause of Mr. Linn's injury. The accident was the result of his own stupidity or carelessness in failing to shut off all power to the press before putting his hand under the ram to ascertain whether the mold was damaged. Mr. Linn testified that he jogged the ram into the desired position by means of the microswitch, pushed the stop button to cut off the power and then hit the microswitch several times to be sure that the power was off before placing his hand in between the ram and the mold. He then stated that the palm of his hand must have hit the microswitch causing the punch (ram) to come down and crush his fingers. Mr. Linn's testimony cannot be accepted at face value. He was either lying or mistaken since he obviously did not shut off the power to the press -

---

7/ Rule 15(c) of the Federal Rules of Civil Procedure provides in part as follows:

> Whenever the claim or defense asserted in the amended pleading arose out of the conduct, transaction, or occurrence set forth or attempted to be set forth in the original pleading, the amendment relates back to the date of original pleading . . .

otherwise his fingers would not have been crushed.[8/] He was unable to account for the ram coming down after he had allegedly cut the power. From the evidence presented it is apparent that the injury to Mr. Linn was caused by the power not being locked out rather than the broken key in the press selector switch as contended by Mr. Linn. Cutting the power off on any electrical machine should furnish 100 percent safety to an operator or person cleaning the machine.

In order for complainant to carry his burden of proof it is necessary for him to establish by a preponderance of the evidence all of the facts set forth in his allegations. This he has failed to do. He alleged that because the selector switch was broken off in the automatic mode the operator could not use the control panel to jog the machine into the desired position for cleaning and could not clean the machine "with the power turned off." It is clear from the evidence that the power could be locked out three different ways; by activating the master switch, the emergency button, and the off button (labelled A, B and C respectively, as shown on exhibit R-1) (Tr. 61, 62, 104, 105). This evidence shows conclusively that an operator cleaning the particular press in question would be able to safely clean the area under the punch with absolutely

---

8/ The investigating officer must have felt the same way in view of his remark under item 17 on his work sheet (exhibit R-6) to the effect that "the employee could have some responsibility as to turning off the machine".

no hazard. The press selector switch, which was in the automatic mode, has very little or no bearing as to why the power was not shut off.

Complainant, in order to sustain a violation of Section 5(a)(1) must prove (1) that the employer failed to render its work place free of a hazard which was (2) recognized and (3) causing or likely to cause death or serious physical harm. Actual occurrence of a hazardous condition is not, by itself, sufficient to prove a violation. Feasible measures to reduce the likelihood that a hazard would occur must be shown. Also, the hazard must be preventable. National Realty & Construction Co. v. OSHRC 489 F2d 1257 (D.C. Cir. 1973). Actual knowledge on the part of an employer satisfies the general duty requirement of recognition. Secretary of Labor v. OSHRC & Vy Lactos Laboratories, Inc. 494 F2d 460 (8th Cir. 1974).

There is no dispute over the fact that the press selector switch was broken off in the automatic mode. According to Mr. Linn he brought this matter to the attention of his supervisors, Mr. Williams, Mr. Chandler, Mr. Miller and his union steward, Mr. Carter. Mr. Carter testified that Mr. Linn told him about the broken key two or three times and that he talked with Mr. Miller and Mr. Dowden about the matter. He agreed with Mr. Linn's belief that a hazard was present. He admitted, however, that he had never brought this matter up at a grievance committee meeting. The company officials, Mr. Miller and Mr. Dowden, as well as foreman Williams, Chandler and Grant, all denied knowing about the broken key in the press selector switch prior to the Linn accident.

After hearing all of the testimony of the witnesses and observing their demeanor it is concluded that the testimony of complainant's witnesses was less convincing than the testimony presented by respondent. Mr. Linn, who was very slow in answering some of the questions put to him, blamed his injury on the company's failure to fix the press selector switch. He also complained about the company's failure to properly train him in the operation of the press and on safety measures in general. Mr. Linn had worked on the press with the switch broken off for a year or more and testified that he knew that the power should be off before putting his hand in the mold. He has known this for two or three years (Tr. 107). He testified that a previous supervisor had told him to cut the machine off before he stuck his hand in the mold (Tr. 109). However, a few minutes later he was asked if Leroy Grant or anyone else had told him not to put his hand in the press with the power on. He answered, "not one of them" (Tr. 116). Mr. Linn also testified that he had been made aware of the safety measures outlined in joint exhibit 1 at the bottom of page 6. This paragraph reads as follows:

> The operator should be fully aware of the dangers of carelessness. When operating a piece of equipment as large and powerful as this press it is a matter of keeping alert, and staying clear of the moving parts of the press, during operation. <u>The only time the operator should have his hands near the moving parts is during cleaning and then the press should be shut down</u>. If at any time a situation arises that the operator must make contact with or near the moving parts of the press or table, <u>the press should be stopped</u>. If an emergency arises due to faulty operation, etc., the press may be stopped by depressing only the drive button, rather than following the sequence usually used for halting the press.

It is obvious from the foregoing that Mr. Linn was aware of the safety measures to be followed in cleaning the machine - the most important of which was to cut the power off. He even testified that he taught new employees to make sure that the power was off and named several of them - Ybanis, Otto, Ruben, Magill and Mondragon. He also indicated that he was the senior press operator in the powder granulate room (Tr. 89).

Mr. Linn in his testimony complained about the broken key being a safety hazard and stated that he knew that an accident was going to happen; that the microswitch was in the wrong place. Apparently, however, he never mentioned this to Mr. Miller (Tr. 90). He stated that he told Mr. Williams about the broken key but that he just "turned around and walked off" (Tr. 90). Although Mr. Linn testified that he pushed the stop button (exhibit R-1, labelled OFF) before he put his hand in the mold, he lost parts of three fingers. It is noted, however, that when Mr. Otto showed him the broken chip he (Otto) had turned the power off. Later Mr. Linn asked which button Mr. Otto turned off and he replied, "I think he stopped - - I know he stopped the granulator, this button here" (meaning the button labelled OFF)(Tr. 105). This testimony makes one wonder whether or not Mr. Linn was in fact relying on Mr. Otto to cut off the power to the press rather than doing it himself.

The union steward, Mr. Carter, testified that Mr. Linn reminded him constantly about the broken key and that he discussed this matter

with management officials, Mr. Miller and Mr. Dowden, because he thought it was a hazard. He admitted that he never filed a grievance on this item even though he was allegedly concerned about it. His excuse for not bringing it up at the grievance meetings was that the company and union representatives were not "communicating" very well and that we were told "to talk more, meet more informally and not file as many grievances as we did in the past" (Tr. 176). It was also apparent from Mr. Linn's testimony and that of company officials that relations between them were very strained.

Although Mr. Linn and Mr. Carter indicated worry over the alleged hazard they never saw fit to discuss it formally with management officials (exhibit R-10). This exhibit reveals certain discussions with Mr. Carter and also contains the minutes of several grievance committee meetings in 1977. At the July 14th meeting, it is noted that Mr. Linn was one of those present. It is apparent from a review of these records that Mr. Carter's concern for work place hazards was sidetracked by his emphasis on personnel grievances, job classifications, discrimination and harassment matters. For instance, one of the grievances (No. 77-09) covered the union's protest regarding the by-passing of Mr. Linn and respondent's failure to upgrade him to a higher classification.

An examination of the grievance committee minutes failed to reflect any discussion about the broken key or any safety complaint regarding the Baldwin-Lima-Hamilton powder press. On one occasion Mr. Carter complained of the shop being dusty. It seems strange that Mr. Carter would see fit to

complain about dusty conditions when he indicated such a concern about the broken key in the press selector switch and unsafe conditions in the shop (exhibit R-5) (Tr. 152, 153).

Mr. Linn, in an effort to show knowledge on the part of respondent, testified that he had seen Mr. Williams put his hand into the mold to remove materials and that Mr. Williams as well as Mr. Miller had seen him place his hand in the point of operation (see Mr. Linn's signed statement - exhibit R-4). He neglected to state, however, whether the power was off on those occasions.

Although citation 2 was labelled a willful violation it has been treated throughout the hearing as a willful serious violation. Section 17(k) of the Act defines a serious violation as follows:

> For purposes of this section, a serious violation shall be deemed to exist in a place of employment if there is a substantial probability that death or serious physical harm could result from a condition which exists, or from one or more practices, means, methods, operations, or processes which have been adopted or are in use, in such place of employment unless the employer did not, and could not with the exercise of reasonable diligence, know of the presence of the violation.

Mr. Linn's failure to have the power off was not known to respondent and there is no reason for respondent to have anticipated that Mr. Linn would place his hand in the mold when the power was on in contravention of company safety measures (see Brennan v. OSHRC & Alsea Lumber Co. 511 F2d 1139 (9th Cir. 1975)). Although there is a sharp conflict in the evidence it is concluded that complainant has not shown by a preponderance of the

reliable and probative evidence that respondent had knowledge of the broken key in the press selector switch.

One of the problems encountered in this case is the inadequate investigation which was conducted in the powder granulate room. Throughout the hearing it was brought out that the Baldwin-Lima-Hamilton powder press was in poor mechanical condition, variously being described as being worn out and needing to be replaced and further that the microswitches were malfunctioning every month or two. It appears that a crucial item here was the location of the microswitch directly in front of and in close proximity to the punch and mold. From the evidence it further appears that very little supervision was afforded the employees who operated the presses. These are matters, however, with which respondent has not been charged.

In view of the foregoing it is concluded that respondent should not be held to have willfully or seriously violated Section 5(a)(1) of the Act (29 USC 654(a)(1)).

## FINDINGS AND CONCLUSIONS

1. The Review Commission has jurisdiction over the parties and subject matter herein and respondent at all times material hereto was engaged in a business affecting commerce within the meaning of Section 3(5) of the Act.

2. On September 16, 1977, respondent had employees in its Carboloy systems department in its Houston plant engaged in operating Baldwin-Lima-Hamilton hydraulic powder presses which turn out tungsten carbide

cakes and as a result of an accident on one of the presses, a representative of the Occupational Safety and Health Administration conducted an inspection between the dates of October 6 and 28, 1977.

3. On September 16, 1977, one of respondent's employees was engaged in cleaning and inspecting the area under the punch or ram of the press to determine whether there was a broken piece of metal or chip in the mold. While performing this function the operator lost a portion of three fingers when the press suddenly became operational.

4. Complainant has failed to establish by a preponderance of the reliable and probative evidence that respondent failed to provide special hand-tools for placing material in the point of operation or for removing materials therefrom as required by the standard found at 29 CFR 1910.212 (a)(3)(iii). The aforementioned press operates automatically with a heavy wire guard in place, making it impossible to use hand-tools during its operational cycle.

5. Complainant has failed to establish by a preponderance of reliable and probative evidence that respondent violated the provisions of 29 CFR 1910.212(a)(3)(ii) which standard requires point of operation guards on machinery so as to protect an employee from the danger zone during the operating cycle. The aforementioned press was equipped with an adequate guard when it was in an operating cycle producing tungsten carbide cakes. The standard in question has no application to cleaning, maintaining, repairing, or inspecting machinery. During the operation of the press there is no way an operator can place any part of his body into the danger zone.

6. Complainant has failed to establish by a preponderance of the reliable and probative evidence that respondent violated 29 CFR 1910.212(a)(1) which standard requires one or more methods of machine guarding to protect operators from the hazards created by the point of operation. When the press is operational, producing a product, it is adequately guarded and an employee has no way of putting a member in the point of operation. This standard does not require a guard when the machine is down for cleaning, maintenance or inspection. While being cleaned or repaired the press produces no sparks, rotating parts, in-going nip points, or flying chips which this standard is designed to guard against.

7. Complainant has failed to establish by a preponderance of the reliable and probative evidence that respondent violated the general duty clause of the Act, Section 5(a)(1) thereof, because it has not been shown that the machine could not be cleaned with the power off as specifically alleged in paragraph VI(c) of the amended complaint. Although a key was broken off in the press selector switch, the evidence reveals that the power to the press could be cut off by manipulating a master switch, an emergency button, or an off button, thereby offering 100 percent protection to an employee engaged in the inspection of the punch or mold. Respondent's safety rule requiring "power off" when the operator's hands or near moving parts during the cleaning operations was well known to the person operating the press.

## ORDER

Based upon the foregoing findings and conclusions and the record as a whole, it is ORDERED that citation 1 and citation 2 be and the same are hereby vacated, along with the penalty proposed therefor.

| SECRETARY OF LABOR,<br>Complainant,<br>v.<br>STRIPE-A-ZONE, INC.,<br>Respondent. | OSHRC Docket No. 79-2380 |

DECISION

Before ROWLAND, Chairman; CLEARY and COTTINE, Commissioners.

BY THE COMMISSION:

An order of Administrative Law Judge Louis G. LaVecchia is before the Commission for review pursuant to section 12(j), 29 U.S.C. § 661(i), of the Occupational Safety and Health Act of 1970, 29 U.S.C. §§ 651-678 ("the Act"). Judge LaVecchia granted a pre-hearing motion to dismiss filed by Stripe-A-Zone, Inc. ("Respondent"), and vacated the citations issued by the Secretary of Labor ("the Secretary"). The dismissal was sought and obtained on the ground that the Secretary failed to issue the citations with "reasonable promptness" as required under section 9(a) of the Act, 29 U.S.C. § 658(a). 1/ Specifically, Judge LaVecchia found that Respondent had been prejudiced by the passage of 177 days from the

---

1/ Section 9(a) of the Act, as codified at 29 U.S.C. § 658(a), provides in pertinent part as follows:

> If, upon inspection or investigation, the Secretary or his authorized representative believes that an employer has violated a requirement of Section 654 of this title, of any standard, rule or order promulgated pursuant to section 655 of this title, or of any regulations prescribed pursuant to this chapter, he shall with reasonable promptness issue a citation to the employer.

date of the alleged violations until the citations now before us were issued, 2/ in that key witnesses would not be present for the hearing on account of illness or unavailability for other reasons. The only issue before us is whether the judge erred in vacating the citations on the ground that they were not issued with reasonable promptness. For the reasons stated in this decision, we conclude that the judge erred.

It is well settled that unless an employer establishes prejudice in the preparation or presentation of its defense a citation will not be vacated for the Secretary's alleged failure to issue it with reasonable promptness. E.g., Stephenson Enterprises, Inc. v. Marshall, 578 F.2d 1021 (5th Cir. 1978); Todd Shipyards Corp. v. Secretary, 566 F.2d 1327 (9th Cir. 1977); Brennan v. Chicago Bridge & Iron Co., 514 F.2d 1082 (7th Cir. 1975); National Industrial Constructors, Inc., 81 OSAHRC 94/A2, 10 BNA OSHC 1081, 1981 CCH OSHD ¶ 25,743 (No. 76-4507, 1981); Stearns-Roger, Inc., 80 OSAHRC 10[illegible]/A2, 8 BNA OSHC 2180, 1980 CCH OSHD ¶ 24,870 (No. 78-819, 1980). Moreover, the Commission has held that the appropriate consideration for determining whether to vacate a citation for the Secretary's noncompliance with section 9(a) of the Act is the prejudice to the employer from the delay rather than the justifiability of the delay. National Industrial Constructors, Inc., supra; Stearns-Roger, Inc., supra.

In the case now before us, the Secretary argues that the citations should not have been vacated because "[i]t is clear from the face of respondent's motion that the prejudice asserted by respondent is unrelated to the alleged delay in the issuance of citations." Indeed, he continues, "[w]hat respondent is complaining of . . . is not [due to] the Secretary's delay in issuing the

---

2/ This case has been before the Commission previously concerning a different issue. Stripe-A-Zone, Inc., 80 OSAHRC 111/D12, 9 BNA OSHC 1040, 1980 CCH OSHD ¶ 24,912 (No. 79-2380, 1980), petition dismissed, 643 F.2d 230 (5th Cir. 1981). The relevant procedural history of the case, including the explanation for the delay in the issuance of the citations, is set forth fully in the Commission's prior decision and it need not be repeated here.

citations but the general delay that has occurred in this case, largely at respondent's own instigation." We agree with this argument.

Respondent's claims of prejudice rest solely on the unavailability of two witnesses. Moore, Respondent's Vice-President and General Manager for safety, suffered a heart attack in September 1980. From that time on, he was no longer able to appear as a witness in this proceeding. Narramore, a former supervisory employee of Respondent, could not be found at his last known address in July 1981 when Respondent attempted to contact him. Even if we assume for purposes of this decision that the unavailability of these two witnesses impairs Respondent's ability to present its case, we cannot find that this was the result of the Secretary's asserted noncompliance with section 9(a). The inspection in this case occurred in November 1978 and the citations were issued in April 1979. Yet, Respondent has failed to establish any connection between the delay in the issuance of the citations and the asserted prejudice resulting from either the September 1980 illness of Moore or the July 1981 unavailability of Narramore. Indeed, Respondent represented to this Commission in January 1980--in its motion to reconsider a Commission order that proceedings be expedited--that "the availability of the relevant witnesses and documents has not changed since the date the original citation was issued." 3/

---

3/ It is clear from the record, e.g., the discovery that had occurred prior to January 1980, that Respondent was fully aware at that time that Moore and Narramore would be "relevant witnesses." Moreover, it is equally clear, since Moore and Narramore were both employees of Respondent at the time of the alleged violation, that Respondent would have been aware of any change in the availability of Moore and Narramore prior to January 1980. We therefore interpret Respondent's January 1980 representation as a statement that Moore and Narramore were still available as witnesses in January 1980, nine months after the citations now on review were issued. We also note that on May 30, 1979, over a month after the issuance of the citations, the Secretary sought to take a discovery deposition of the prospective witness Narramore. On June 5, 1979, the Respondent filed an opposition to Complainant's request to take this witness' deposition. We assume that, if there had been any problem with Narramore's availability as a witness at that time, Respondent would have joined in the Secretary's request rather than opposing it, as Respondent did.

Having failed to demonstrate that the asserted prejudice in this case resulted from the Secretary's delay in issuing the instant citations, Respondent did not establish circumstances warranting dismissal and its motion to dismiss for failure to comply with section 9(a) of the Act should not have been granted. See Stephenson Enterprises, Inc. v. Marshall, supra; [4/] Todd Shipyards Corp. v. Secretary, supra. Cf. ASARCO, Inc., El Paso Division, 80 OSAHRC 99/A3, 8 BNA OSHC 2156, 1980 CCH OSHD ¶ 24,838 (Nos. 79-6850 et al., 1980) (dismissal based on the Secretary's failure to comply with the Commission's Rules of Procedure was unwarranted where prejudice due to the unavailability of witnesses' testimony was "not attributable to the Secretary's noncompliance").

Accordingly, Judge LaVecchia's September 16, 1981 order is reversed, Respondent's motion to dismiss is denied, the Secretary's April 26, 1979 citations are reinstated, and the case is again remanded to the judge for further proceedings.

SO ORDERED.

FOR THE COMMISSION

Ray H. Darling, Jr.

Ray H. Darling, Jr.
Executive Secretary

DATED: MAY 28 1982

---

4/ In Stephenson Enterprises, Inc. v. Marshall, the Fifth Circuit stated:

> [B]ecause Stephenson has shown no prejudice from the alleged failure to issue the citations earlier and because the record gives us no grounds to presume prejudice, we need not consider whether the Secretary's conduct . . . accorded with Section 9(a)'s requirement that citations be issued with "reasonable promptness."

578 F.2d at 1023.

ROWLAND, Chairman, concurring:

I agree with the majority that Respondent did not demonstrate any prejudice which resulted from the Secretary's delay in issuing the citations. I disagree, however, with the majority opinion insofar as it holds that the Commission cannot consider the justifiability of the delay in determining whether to vacate citations issued in violation of the reasonable promptness requirement of section 9(a).

The Commission is empowered to "fashion a rule giving the 'reasonable promptness' language [in section 9(a)] some effect." Chicago Bridge & Iron Co., supra at 1085. See Todd Shipyards Corp., supra at 1330, citing Chicago Bridge & Iron Co. While, as the majority points out, those courts which have addressed the question have applied the Commission's test based on a showing of prejudice, the facts before the courts in those cases did not demonstrate delay which on its face could be characterized as unjustified. Therefore, the courts had no occasion to consider whether the prejudice test adopted by the Commission would be appropriate in all situations.

In order to give proper effect to the "reasonable promptness" language in section 9(a), the Commission should not, in my view, limit itself to examining only whether the employer was prejudiced by the Secretary's delay in issuing the citations. The Commission should also give relief to an employer in situations where the delay is patently unreasonable, unnecessary, and unjustified. Consistent with the statutory language that citations be issued promptly, I conclude that a citation should not be allowed to stand when unreasonable and unjustified delays unnecessarily postpone the citation--and subsequent proceedings before the Commission--for alleged violations of the Act. See generally Jack Conie & Sons Corp., 76 OSAHRC 70/A2, 4 BNA OSHC 1378, 1976-77 CCH OSHD ¶ 20,849 (No. 6794, 1976) (lead and concurring opinions). However, that is not the situation before us in this case.

In this case, the Secretary originally issued citations less than two weeks after the inspection. He then moved to withdraw the citations and that motion was granted by Judge Tenney. Only one day after Judge Tenney's order became final, the Secretary issued the present citations. Stripe-A-Zone, Inc., supra note 2. In its prior decision in this case, the Commission approved of the Secretary's actions in awaiting a final Commission order on the withdrawal of the prior citations before issuing the citations at issue here. Inasmuch as the Secretary issued the present citations immediately after Judge Tenney's order became final, I conclude that the Secretary's delay from the date of inspection to the issuance of present citations was not unreasonable, unnecessary, and unjustified.

Indeed, to vacate the citations on the grounds that the Secretary's delay was unreasonable, unnecessary, and unjustified would be contrary to the Commission's prior holding that "[t]he Secretary is entitled to pursue an adjudication on the merits of these citations." 80 OSAHRC 111/D12, p. 7, 9 BNA OSHC at 1043, 1980 CCH OSHD ¶ 24,912 at 30,724. Cf., e.g., American Cyanamid Co., 81 OSAHRC 69/F5, 9 BNA OSHC 2052, 1981 CCH OSHD ¶ 25,504 (No. 77-3752, 1981) (prior decision constitutes law of the case which must be followed in subsequent decision respecting the same case.)

Accordingly, I concur with the majority's decision to reverse the judge's order and reinstate the citations.

|---|---|
| SECRETARY OF LABOR,<br>Complainant,<br>v.<br>STRIPE-A-ZONE, INC.,<br>Respondent. | OSHRC DOCKET NO. 79-2389 |

**ORDER**

The respondent's motion to dismiss this proceeding, filed on July 24, 1981, has been considered. Respondent contends that the citations were not issued with reasonable promptness because of the passage of 177 days, 4 days short of the statutory limit, before the issuance.

Prejudice is asserted by the respondent in that key witnesses, by virtue of illness or unavailability for other reasons, will not be on hand for the trial.

Respondent's motion appearing to be well taken for the reasons asserted, the motion to dismiss is granted.

The citations are vacated. The complaint is dismissed.

So ORDERED.

## NOTICE OF DECISION

Secretary of Labor v. Mesquite Building Systems
OSHRC Docket NO. 81-0678

1. Enclosed is a copy of my decision. It will be filed with the Commission on April 28, 1982, and will become the final order of the Commission on May 28, 1982, unless a Member of the Commission directs that it be reviewed.

2. You may petition for discretionary review of this decision by the Commission. A petition may be filed directly with me within twenty (20) days from the mailing of my decision. Thereafter, a petition should be mailed to the Executive Secretary, Attention:

   Chief Review Counsel
   Occupational Safety and Health Review Commission
   1825 K Street, N.W., Suite 601
   Washington, D. C. 20006.

   Any petition filed directly with the Commission will be considered to the extent that time and resources permit. The last day the Commission may consider your petition is May 28, 1982. This final order date is fixed by law and cannot be extended under any circumstances.

3. If review is ordered by a Member of the Commission, each party to this case will be notified. In addition, each party will be given an opportunity to submit a brief to the Commission.

4. Please complete the enclosed postcard indicating whether you presently intend to seek review of this decision and mail the completed card promptly. Your response does not bind you in any way, but it assists the Commission in processing your petition when it is filed.

5. For any further details on the review process, see Commission Rules 90, 91, 92 and 93.

ORDER VACATING NOTICE OF CONTEST
AND IN THE ALTERNATIVE GRANTING DEFAULT JUDGMENT

BLYTHE, Judge:

For the second time, this case was set for hearing on the merits at 10:00 a.m. on March 22, 1982, and at the same time the respondent was ordered to show cause why its notice of contest should not be vacated for failure to certify that it had posted the notice of contest for the benefit of affected employees in accordance with Rule 7(g) of the Commission's Rules of Procedure.

The Secretary was represented at the hearing by Max A. Wernick, Esq., but neither the respondent nor the affected employees were represented. The Secretary moved to vacate the notice of contest and in the alternative for default judgment.

This is the second time the respondent has failed to appear for a hearing. However, at the first hearing, on November 16, 1981, the Secretary

announced that a settlement had been agreed to by the parties. An order was entered November 16, 1981, directing the respondent to submit the signed settlement agreement with 30 days. The Secretary, by letter dated October 21, 1981, (Exhibit C-1) submitted the proposed settlement agreement to respondent, and in a letter dated January 18, 1982, (Exhibit C-2) he urged respondent to sign and return the agreement. At the latest hearing, Mr. Wernick detailed his efforts to contact respondent's president and pro se representative, A.J. Walker, including two telephone calls answered only by an electronic device with which he left messages. One of these calls was made during a 30-minute recess after the latest hearing was called to order.

The respondent is therefore found to be in default, both on the order to show cause and for failure to appear at the hearing on the merits. It is therefore ORDERED that:

1. The motion to vacate respondent's notice of contest is granted.

2. In the alternative, the Secretary's motion for default judgment is granted, and the citations and proposed penalties issued to respondent January 27, 1981, are affirmed.

DEE C. BLYTHE
Administrative Law Judge

# OCCUPATIONAL SAFETY AND HEALTH REVIEW COMMISSION

## NOTICE OF DECISION

Secretary of Labor v. R. L. MANNING COMPANY
OSHRC Docket No. 80-2827

1. Enclosed is a copy of my decision. It will be filed with the Commission on May 6, 1982, and will become the final order of the Commission on June 7, 1982, unless a Member of the Commission directs that it be reviewed.

2. You may petition for discretionary review of this decision by the Commission. A petition may be filed directly with me within twenty (20) days from the mailing of my decision. Thereafter, a petition should be mailed to the Executive Secretary, Attention:

   Chief Review Counsel
   Occupational Safety and Health Review Commission
   1825 K Street, N.W., Suite 601
   Washington, D.C. 20006.

   Any petition filed directly with the Commission will be considered to the extent that time and resources permit. The last day the Commission may consider your petition is June 7, 1982. This final order date is fixed by law and cannot be extended under any circumstances.

3. If review is ordered by a Member of the Commission, each party to this case will be notified. In addition, each party will be given an opportunity to submit a brief to the Commission.

4. Please complete the enclosed postcard indicating whether you presently intend to seek review of this decision and mail the completed card promptly. Your response does not bind you in any way, but it assists the Commission in processing your petition when it is filed.

5. For any further details on the review process, see Commission Rules 90, 91, 92, and 93.

Quentin P. McColgin
Quentin P. McColgin
Judge, OSHRC

Date: May 6, 1982

OSHRC FORM 97

OCCUPATIONAL SAFETY AND HEALTH REVIEW COMMISSION

| | |
|---|---|
| SECRETARY OF LABOR<br>Complainant,<br>v.<br>R. L. MANNING COMPANY,<br>Respondent. | OSHRC DOCKET NO. 80-2827 |

APPEARANCES:

Jerry R. Atencio, Esquire, of Denver, Colorado
for Complainant
David M. Berrett, Esquire, of Denver, Colorado
for Respondent

DECISION AND ORDER

Quentin P. McColgin, Administrative Law Judge: This is a proceeding under §10(c) of the Occupational Safety and Health Act of 1970 (the Act), 29 U.S.C. § 659(c), involving an alleged violation of §5(a)(2) of the Act, 29 U.S.C. §654(a)(2).*/ The principal issue which requires resolution is whether respondent's failure to guard rotating machinery on its oil rig (the kelly bushing and the rotary table) violates the general machine guarding standard codified as 29 C.F.R. §1910.212(a)(1).

This matter arose out of an inspection which resulted in the issuance of two citations to respondent. Respondent duly filed a Notice of Contest which contested the single item contained in the serious citation (Citation

*/"Each employer-- shall comply with each of the occupational safety and health standards promulgated under this [Act]."

No. 1, Item No. 1) as well as two of the items contained in the non-serious citation (Citation No. 2, Item Nos. 1 & 3). During the hearing, complainant moved to withdraw the charge as set forth in Citation No. 2, Item No. 1, on the basis of insufficient evidence. (Tr. 54)*/ Additionally, respondent moved to withdraw its Notice of Contest as to the remaining non-serious item (Citation No. 2, Item No. ), indicating that such action was not based upon a promise made to it by another party. (Tr. 54) There being no objection,**/ both motions were granted and Citation No. 2, Item No. 1 was vacated and Citation No. 2, Item No. 3, was affirmed.***/

Additionally, the parties have entered into certain stipulations wherein it is agreed that certain testimony which was heard in another case in which the undersigned presided as well as certain exhibits which were proffered in that case would be considered in this case the same as if it were heard and received herein. (Tr. 57) The testimony offered by stipulation consisted of pertinent portions of the transcript of four witnesses who testified in Exeter Drilling Northern Inc., Docket Nos. 80-0496 & 80-1483 (Exeter) during hearings which were conducted September 10-12, 1980. The specific testimony that was so entered into evidence in this case is set forth at pages 7 and 8 of the transcript. Essentially, the stipulation operates to admit into evidence in this case all the testimony of one witness for complainant, Mr. Edward Kassak, and three witnesses for respondent, Messrs. Larry Dernbach, Keith E. Wetterstrom,

---

*/ The following abbreviations will be used in this decision:
Tr. - Transcript page number
E. Tr. - Exeter transcript page number
C. - Complainant's exhibit number
R. - Respondent's exhibit number

**/ There was no appearance entered at the hearing on behalf of any of the affected employees. (Tr. 4)

***/ An order confirming this action is included herewith.

and Philip W. Blake except for those portions of their testimony which went to issues in the Exeter case which are not present here. It was further stipulated that this testimony would be received in evidence in this case as C-24 through C-26.*/ Additionally, it was stipulated that certain exhibits that were offered into evidence in the Exeter case "shall be deemed to be exhibits that were offered into evidence [in this case]." These exhibits consist of C-5 through C-8 and C-12 through C-20 inclusive as well as R-1, R-4, R-5, and R-6.**/

At the conclusion of the hearing, both parties waived closing argument and indicated their intention to file briefs. (Tr. 133-134) Thereafter, both parties submitted briefs in support of their respective positions. Additionally, respondent filed both proposed findings of fact and conclusions of law.

Having heard and observed the witnesses and having considered the testimony and other evidence together with the pleadings and arguments presented in this matter, the undersigned hereby issues the findings, conclusions, and order set forth in this decision. To the extent that the proposed findings of fact or proposed conclusions of law have not been adopted in this decision, they are rejected as being either inaccurate or unnecessary to the disposition of this case.

---

*/ C-24 consists of the excerpted testimony of Mr. Edward Kassak given during direct examination on September 10, 1980. C-24 contains the testimony given on September 11, 1980, which consists of the remainder of Mr. Kassak's testimony as well as that of Messrs. Dernbach and Wetterstrom. C-26 consists of the testimony elicited from Mr. Blake on September 12, 1980..

**/ This stipulation is set forth in the filing received January 19, 1981, entitled, "Stipulated List of Exhibits." This list includes three exhibits which were rejected (C-15, C-17, and C-18, as well as one exhibit which was not offered (C-16). As to the rejected exhibits, the parties recite in their stipulation "they are included in the record for this proceeding, along with the rulings on why they were not included in the record, in order to preserve those questions for review, if such review is necessary."

## DISCUSSION

The undersigned has previously heard and decided a case involving the same issue as is presented here, namely, whether the failure to guard a kelly bushing and the rotary table violates the machine guarding standard. In Exeter Drilling Northern Inc., Docket Nos. 80-0496 and 80-1483 (Exeter) (decided April 19, 1982) the undersigned found that based upon the record in that case, the failure to guard a kelly bushing did not violate the machine guarding standard. However, the disposition of that earlier case is not necessarily dispositive of this case. This is so because of the differences in the physical characteristics of the relevant machinery, the differences in the evidence pertaining to the perceived hazards, and the differences in emphasis and content of the arguments advanced in support of and in opposition to the violation. Thus, the decision in this case must be based upon this record.

The specific allegation, as set forth in Citation No. 1, Item No. 1, is:

> 29 CFR 1910.212(a)(1): Machine guarding was not provided to protect operator(s) and other employees from hazard(s) created by:
>
> > rotating parts of the rotary table and kelly bushing were not guarded.

The cited standard, 29 C.F.R. §1910.212(a)(1), provides:

> One or more methods of machine guarding shall be provided to protect the operator(s) and other employees in the machine area from hazards such as those created by point of operation, incoming nip points, rotating parts, flying chips and sparks. Examples of guarding methods are--barrier guards, two-hand trippping devices, electronic safety devices, etc.

The two parts of machinery referred to in the above-quoted citation are two of the three principal rotating parts that are situated at the

center of the floor of an oil rig. The function of these parts is to convert the power derived from the engines into a rotating force which, in turn, causes the drill stem to rotate, which is the means by which a hole is dug in the ground by an oil rig.

The drill stem begins at the top with a swivel which is hooked to the lower portion of the hoisting mechanism of a rig called the traveling block. Below the swivel is the third principal rotating part called the kelly which is a three-, four-, or six-sided piece of pipe, usually about forty feet long. The kelly is attached to lengths of drill pipe or drill collars, lengths of which are connected together to form the vast bulk of the drill stem. Below the lowest length of drill pipe is the drill bit, which actually operates to dig the hole in a rotating motion.

The rotary table consists of a number of different parts, most of which are located below the rig floor. The top surface of the rotary table is generally flush with the rig floor.*/ Most of the rotary table is covered, however, a portion is not. The kelly bushing sits on top of the rotary table. It mates with the master bushing which is a part of the rotary table. Power is, thus, transferred from the engines to the rotary table which generates a rotational motion. When the rotary table rotates, the kelly bushing also rotates. The rotation of the kelly bushing, in turn, causes the kelly to rotate which then causes the entire drill stem to rotate. This rotational motion, coupled with the vertical force created either by the weight of the traveling block or the weight of the drill stem is the means by which the hole is dug.

The kelly bushing involved here is a Varco 4KRVS bushing (Tr. 38) That portion of the kelly bushing which extends above the rotary table

*/ In this case the rotary table rests on a platform which is elevated above the rig floor 1 and 1/2 inches. (Tr. 61)

is 24 inches in diameter (Tr. 37)*/ It is constructed of metal and weighs 859 pounds. (C-21) It is considered by the industry to be a new-type "smooth" bushing as distinguished from the old-type kelly bushing which has protruding J-bolts. (Tr. 85, E. Tr. 439) While it is not smooth in the true sense of the word, it is as smooth as any comparably sized bushing in the industry. (Tr. 70, 75, 116, E. Tr. 409, 437-439, 485)**/

As depicted in both the photograph of the bushing (C-27) and the sketch of the model contained in the Varco sales literature (C-21), there are indentations and protrusions on the kelly bushing. However, they appear to be recessed, with the edges smooth so that no sharp edges are presented. There are three inch bolts on the top of the kelly bushing; however, the photograph and the sketch indicate that these bolts are placed in recessed areas so that they do not protrude significantly if at all from the generally flat surface of the top. (Tr. 39, C-21, C-27) The sides of the bushing contain rollers which are estimated to be 14 inches measured horizontally and 10 inches vertically. (Tr. 39) It appears from the sketch that these rollers do not protrude significantly from the hemispherical surface of the kelly bushing's sides, although no measurements were given as to the extent to which they do protrude. (C-21)

Other physical characteristics of the equipment are that the diameter of the rotary table was 30 inches. (Tr. 37) The kelly was four-sided, with each side measuring 4 1/2 inches (Tr. 38) At the time of the inspection, they were drilling at 5,804 feet. (Tr. 20) The kelly, the kelly bushing and the rotary table were rotating at 70 revolutions per minute. (Tr. 19)

---

*/ Industry classifies this as a 17 1/2 inch kelly bushing, which is actually the diameter of that portion of the kelly bushing which mates with the rotary table and is below the level of the platform. (Tr. 83)

**/ There is evidence that a much larger bushing used on large rigs to dig deeper wells has a smoother surface than this bushing. (Tr. 117)

In order to establish a prima facie case that an employer has violated the cited standard, the Secretary must show (1) the cited standard applies to the facts, (2) there was a failure to comply with the cited standard, (3) employees had access to the hazardous condition and (4) the employer knew or could have known of the condition with the exercise of reasonable diligence. Daniel International Corp., Wansley Project, 9 BNA OSHC 2027, 1981 CCH OSHD ¶25,813 (No. 76-0181, 1981.)

Respondent's challenge to the existence of these elements is essentially limited to the first element, namely the applicability of the standard to respondent's drilling operations. As to the other elements, respondent readily admits that it did not guard the kelly bushing and the rotary table. The proof shows that respondent's employees walked within two feet of the subject rotating parts; hence, respondent's employees clearly had physical access to the conditions presumed to be hazardous by the standard. Further, it is clear that the failure to guard these rotating parts was a conscious decision of respondent's representatives; hence, respondent is charged with knowledge of these conditions.

Before turning to the arguments pertaining to the applicability of the standard, it is first of all helpful to consider the nature of the hazards which are perceived by complainant to result from failing to guard the kelly bushing and the rotary table and secondly to consider complainant's failure to charge respondent with failing to guard the rotating kelly, which is equally accessible to respondent's employees. However, before doing so, it is noted that the official position with respect to this latter rotating part: "OSHA is not intending to guard the kelly at this time." (E. Tr. 256)[*] This is so even though the basic

[*] The record in this case does not indicate the rationale for this position.

principle underlying the citation is: "Anything that is rotating, a coupler or a shaft, no matter how smooth it is, should be covered." (E. Tr. 215, 275)

The perceived hazards of the unguarded kelly bushing and rotary table were described by the compliance officer who conducted the inspection as follows:

> . . People could fall into the bushing, slip, trip on the rig floor, step on the rotary table and be thrown off the rotary table, collide with the standing pipe section of pipe in the mousehole, could be knocked down in such a way to break bones, severe lacerations, could be caught with their clothing in the rotating bushing. But probably most importantly, is the spinning chain becoming caught and entwined and wrapped around the rotating bushing and catching the floorman and becoming a part of the rotating bushing and being killed or amputated, having a leg amputated or arm amputated. Such things as tools dropping into the rotating table and bushing, very strong possibility. Other tools that are used on the rig such as a water hose to wash the rig floor down could be caught in the rotating bushing and table . . . . (Tr. 42)
>
> * * *
>
> "The hazard would be coming into contact with the rotary bushing and rotary table by approaching, either stepping, falling, slipping into it, clothing being caught, a tool being caught, spinning chain being caught in the bushing." (Tr. 55)

In analyzing these perceived hazards, it appears that three are directed toward the hazards presented by the kelly bushing and a fourth is directed toward the hazards presented by the rotary table. The first kelly bushing hazard is that resulting from contact with the bushing by falling onto it. The second kelly bushing hazard is that of clothing being caught in the rotating bushing. The third is what shall here be described as the entanglement hazard. If one of the tools, such as the spinning chain or a hose were to become wrapped around the rotating bushing, and if an employee were to become entangled with such tool, the

employee could then become entwined with the rotating bushing which would likely result in either death or amputation. The hazard of the rotary table is that of stepping on it and being thrown off onto one of the pieces of nearby heavy equipment.

While the record in this case is silent as to why OSHA does not require the guarding of the kelly, it appears that at least two of the three perceived hazards of the kelly bushing are also present with respect to the kelly. If someone were to fall on the kelly, the injuries would be as serious if not more so than if he were to fall upon the kelly bushing. Indeed, complainant's own compliance officer recounted incidents where a person had his scalp removed and amputations that resulted from falling into rotating shafts. (Tr. 79) Moreover, entanglement with the kelly with resulting death or amputation seems as likely as such entanglement with the kelly bushing. Indeed, one of the three entanglement incidents that resulted in a fatality or amputation appears to have involved the kelly rather than the kelly bushing. (E. Tr. 447-448, C-14)

Turning now to the issue of the applicability of the standard, respondent raises essentially four arguments or defenses in support of its contention that the standard is inapplicable to its operations. The first argument goes to the prima facie applicability of the standard. Here, respondent, relying upon the Commission's decision in Allis-Chalmers Corporation, 4 BNA OSHC 1876, 1976-77 CCH OSHD ¶21,341 (No. 7482, 1976), argues that the general machine guarding standard of 29 C.F.R. §1910.212(a)(1) "is clearly directed towards [machines] which

are or can be used in the production or manufacturing process." (Respondent's brief at 2) Respondent then seems to argue that it is not engaged in the production or manufacturing process but rather is merely engaged in a process of extracting raw material from the ground. (Respondent's Brief at 3)

This argument is unpersuasive. The best that could be said for it is that respondent has made a good case that it is not engaged in the manufacturing process. It ignores, however, the issue of whether it is engaged in the production process. Production is defined in Black's Law Dictionary (Rev. 4th Ed. 1968) as "[t]hat which is produced or made product; fruit of labor . . . ." The extraction of oil or gas from the ground is clearly the initial step in the process which results in the production of finished products such as gasoline or other petrochemical products. Thus, the perview of the standard would, in the abstract, appear to encompass machines used in respondent's drilling operations.

Respondent's second applicability argument is that the standard, being a general standard, is unenforceably vague unless it is interpreted as requiring a showing that the required protective measures were generally recognized by the particular industry as being clearly appropriate under the circumstances. (Respondent's brief at 4) Respondent bases this argument upon the several decisions of the Circuit Courts of Appeal, e.g., B&B Insulation Inc. v. OSHRC, 583 F. 2d 1364 (5th Cir. 1978), which have imposed such a special burden in cases involving other general standards such as the Personal Protective Equipment Standard.*/

*/ That standard, 29 C.F.R. §1926.28(a) provides:

> The employer is responsible for requiring the wearing of appropriate personal protective equipment in all operations where there is an exposure to hazardous conditions or where this part indicates the need for using such equipment to reduce the hazard to the employees.

Respondent then argues that complainant failed to meet this burden of proof; hence, the charge has not been established.

There is no question but that the evidence in this case does not establish that a reasonable employer in the oil drilling industry would have protected against the rotating kelly bushing and rotary table by guarding such parts. Nevertheless, this argument fails because the standard involved here, while general in its scope, is not so broadly worded as to superimpose upon complainant the burden of making such special showing. See S&H Riggers & Erectors, Inc., v. OSHRC, _____ F. 2d _____, 10 BNA OSHC 1057, 1981 CCH OSHD ¶25,733, (5th Cir. 1981). Here, the machine guarding standard is emphatic in its requirement that guarding be provided as protection from "hazards such as those created by . . . moving parts . . . ." 29 C.F.R. §1910.212(a)(1).

The remaining matters going to the applicability of the standard which, for the most part, are contained in the affirmative defenses of estoppel and vagueness (Respondent's Brief at 15 and 16),[*/] make a compelling showing that the standard should not be applied to require a kelly bushing guard. This determination is primarily based upon the circumstances unique to the oil drilling industry, which result in the standard giving insufficient warning of the proscribed conduct when measured against common understanding and practice.

The first consideration which leads to this conclusion is the non-specifity of the general guarding standard. While, in the abstract, an oil rig would appear to be encompassed within the infinite variety of

---

[*/] See also respondent's arguments pertaining to the industry understanding of the guarding requirements set forth in Respondent's brief at 6-9.

machines which come within the perview of the standard, an oil rig is not generally considered to be a machine.*/ Thus, there is an element of ambiguity in the standard created by the nonspecifity of what is included as machines and the absence of a definition of a machine within the standard itself.

The second consideration is the common understanding and commercial practice relative to kelly bushing guarding. The most graphic evidence of industry's lack of awareness of the requirement to guard kelly bushings and rotary tables and the prevalence of the practice within the industry not to guard such parts is the testimony of the compliance officer who, after one hundred inspections of oil rigs, had never seen a kelly bushing guard in operation. (Tr. 67)

The third and final consideration leading to this determination is the pattern of administrative enforcement, which operated to confirm industry practice. Through a variety of different actions by OSHA and others, members of the oil drilling industry could reasonably infer that "smooth" kelly bushings were not required to be guarded.

The actions by OSHA which contributed to this belief consisted essentially of three inconsistent enforcement policies which, to the extent that it did not confuse the industry and constitute arbitrary and capricious action, led industry members into the belief that "smooth" kelly bushings need not be guarded. The first of these actions is that

---

*/ It appears that, initially, it did not even occur to the Secretary that rotating parts of oil rigs were encompassed within the variety of machines within the perview of the machine guarding standard. Thus, in the early cases where the failure to guard kelly bushings was challenged as violating safety standards, the respondents were cited for violating standards other than this one. DB Drilling Corporation, 78 OSAHRC 21/D2 (No. 76-4668, 1978); MND Drilling Corporation, 77 OSAHRC 183/C5 (No. 76-4149, 1977).

which has already been referred to, namely, OSHA's policy of not requiring the guarding of the kelly, which is equally hazardous and accessible to oil rig workers as is the kelly bushing. The second is OSHA's policy of requiring the guarding of "smooth" kelly bushings in some areas of the country and not in others (E. Tr. 272, 481, 487, 496) The third and most graphic evidence of this inconsistent policy is presented in the form of what appears to be a clarifying statement contained in the memorandum dated June 19, 1979, from the Director, Federal Compliance and State Programs, to one of OSHA's regional administrators which provides:

> Kelly Bushings on oil drilling rigs that are smooth and do not present a potential hazard to employees that come in contact with the Bushings, do not require guarding. However, Kelly Bushings with projections or indentations do present a potential hazard to employees who come in contact with the Bushing and shall be guarded or employer shall be appropriately cited. (R-6)

Inasmuch as the kelly bushing involved here was one of the two principal types of kelly bushing which the industry considers smooth, (E. Tr. 439) and inasmuch as there is no substantially smoother kelly bushing of this size, the most reasonable interpretation of this statement is that kelly bushings such as the one involved here need not be guarded. In fact, persons associated with the oil drilling industry so interpreted this statement. (Tr. 485-487)

Actions of other enforcement agencies also contributed to the belief that "smooth" kelly bushings need not be guarded. The record shows that a number of states wherein oil drilling is prevalent which states have approved safety programs do not require the guarding of "smooth"

kelly bushings. (E. Tr. 480) These states are Utah, Michigan, Wyoming, California, and Alaska. (E. Tr. 480)[*/]

Finally, the decisions of Commission Judges which preceded the issuance of this citation contributed to the view that "smooth" kelly bushings need not be guarded. Research discloses eight cases that were decided prior to the issuance of the citation sub judice involving the failure to guard kelly bushings. Two of these were based upon alleged violations of standards other than the machine guarding standard and resulted in the citations being vacated based, in whole or in part, upon the inapplicability of such other standards. DB Drilling Corporation supra; MND Drilling Corporation, supra (also greater hazard). One case, Signal Oilfield Services Inc., 78 OSAHRC 39/D1 (No. 77-0026, 1978), which involved the old-style kelly bushing with protruding J-bolts, held that the failure to guard that kelly bushing violated the machine guarding standard. Of the remaining five cases, four vacated citations alleging violations of the machine guarding standard based upon findings of greater hazard. Graywolf Drilling Company, 78 OSAHRC 94/A8 (No. 77-3803, 1978); Circle Bar Drilling Company, 78 OSAHRC 82/D4 (No. 77-3581, 1978) (also lack of employee exposure); Graywolf Drilling Company, 78 OSAHRC 70/F1, 1978); Hughes Drilling Company, Inc., 79 OSAHRC 58/A2 (Nos. 76-2945 & 76-3574, 1977). In only one of the eight cases was the alleged violation of the machine guarding standard affirmed. Fred Wilson Drilling Company, Inc., 78 OSAHRC 67/D2 (No. 77-3578, 1978). However, that decision, which is the only one reviewed on appeal, was subsequently reversed on appeal

---

[*/] Only Wyoming's standard contains express provisions exempting kelly bushings from guarding requirements. (E. Tr. 480, R-1)

based upon a finding of greater hazard. Fred Wilson Drilling Company, Inc., v. Marshall, 624 F. 2d 38 (5th Cir. 1980). Thus, the most reasonable interpretation of these decisions is that "smooth" kelly bushings need not be guarded.

These considerations, considered in unison, have operated to either obfuscate or limit the scope of the standard so as to create a reasonable belief in the minds of members of the oil drilling industry that "smooth" kelly bushings need not be guarded. For this reason, it is found that the standard, as applied to the guarding of "smooth" kelly bushings, did not contain sufficient warning as to its requirements and is, therefore, unenforceably vague. Diebold Inc. v. Marshall, 585 F. 2d 1327 (6th Cir. 1978). It is further found that the statement from the Director, Federal Compliance and state Programs, previously quoted, constitutes an express statement by a responsible official of the enforcement authority, indicating a conscious decision to restrict the application of the standard to types of kelly bushings other than that which is involved here. Having so restricted the scope of the standard, complainant is estopped from applying it in this case. See Seattle Crescent Container Services, 7 BNA OSHC 1895, 1979 CCH OSHD ¶24,002 (No. 15242, 1979).

Respondent has raised two additional affirmative defenses to the machine guarding charge. These are the impossibility of compliance and greater hazard defenses. In order to avoid a remand should the foregoing determinations be reversed on appeal, these defenses will also be addressed.

The impossibility of compliance defense is based upon the overwhelming evidence in this record that any kelly bushing guard will present accident hazards. Because of this circumstance, respondent argues that by guarding the kelly bushing, it would be violating 29 C.F.R. §1910.212(a)(2) which provides "the guard shall be such that it does not offer an accident hazard in itself." Inasmuch as the Commission has held that the latter provision cannot be asserted as a defense to the machine guarding standard, this defense must fail. Weyerhaeuser Co., 4 BNA OSHC 1972, 1976-77 CCH OSHD ¶21,465 (Nos. 1231 & 1758, 1977).

To establish the final asserted defense, that of greater hazard, it must be shown that (1) the hazards of compliance are greater than the hazards of noncompliance; (2) alternative means of protecting employees are unavailable; and (3) a variance application was inappropriate. M. J. Lee Construction Co., 7 BNA OSHC 1140, 1979 CCH OSHD ¶23,330 (No. 15054, 1979).

In order to determine, in this case, whether a kelly bushing guard presents more of a hazard than does an unguarded "smooth" kelly bushing, it is necessary to identify, evaluate, and compare the hazards presented in each circumstance. The evidence of hazards presented by an unguarded kelly bushing principally consists of the previously quoted testimony of complainant's compliance officer. The hazards he perceived are:

1. The possibility of falling on the rotating kelly bushing
2. The possibility of clothing being caught on the kelly bushing
3. The entanglement hazard which, as described, is limited to the kelly bushing
4. The possibility of someone stepping on the rotary table and being thrown into one of the nearby pieces of heavy equipment.

With respect to kelly bushing guards, the evidence shows the following types of perceived hazards:

1. Interference of the kelly bushing guard with the tong lines, creating the possibility of the tongs being swung into a floorhand. (E. Tr. 460-461)
2. The possibility of a guard acting as a deflecting shield in the event of a blowout. (E. Tr. 463)
3. Interference with the mating of the kelly bushing with the master bushing due to the visual obstruction caused by the presence of a guard, with consequent risk of hand or finger amputations. (E. Tr. 479)
4. The possibility of a guard becoming disengaged from the catline and falling upon the employees working below while they are engaged in making a connection. (Tr. 126-128)
5. The possibility that parts of the kelly bushing or the kelly bushing guard, unseen by the driller, will vibrate loose and then fall onto the hands below when the kelly bushing is raised above their heads. (E. Tr. 465-466)
6. The possibility that a guard made of expanded metal might become misshapen and catch on the kelly bushing and rotate in such a manner as to present a danger to employees. (E. Tr. 463)
7. The possibility of pinched fingers, toes, or strained backs resulting from moving the heavy two-piece removable type guard (E. Tr. 469-470), or the cumbersome combination of the kelly bushing and guard in the case of the one-piece guard. (E. Tr. 479)

8. In the case of the removable type guard, blocked escape routes caused by the necessity of storing the guard during certain phases of the drilling operations within the limited space available on the drill floor. (E. Tr. 472)

Based upon the empirical evidence in this record, kelly bushing guards have resulted in more injuries than have unguarded "smooth" kelly bushings. Complainant offered evidence of three accidents that resulted in either a fatality or an amputation which involved unguarded kelly bushings. (E. Tr. 171-181, 188-196, 280). However, one of these involved an old-style kelly bushing with protruding J-bolts. (E. Tr. 435-437) In another, the cause of the accident was attributable to the rotating kelly rather than the kelly bushing. (E. Tr. 441-448) Only one of these accidents would not have occurred had the kelly bushing been guarded. (E. Tr. 227) That accident resulted in an amputation of an employee's legs. (C-12) In contrast, the types of hazards described above that are associated with kelly bushing guards have resulted in numerous injuries ranging from minor bruises (E. Tr. 465-466, 479); fractures (E. Tr. 424-425); an amputation (E. Tr. 479) to a fatality (E. Tr. 466). Additionally, there have been other serious injuries which are attributable to the presence of a kelly bushing guard. (E. Tr. 307, 312-313, 315-319, R-4, R-5).

A qualitative evaluation of these perceived hazards also supports the conclusion that, in this case, the hazards of a guard are greater than the hazards of the unguarded "smooth" kelly bushing that was operating on the respondent's rig.

In evaluating the perceived hazards of an unguarded kelly bushing, one of them stands out as significant. If an employee becomes entangled with a chain or hose, which in turn becomes entangled with any of the rotating parts located at the center of the drill floor, then death or serious physical injury is probable. However, as to the other perceived hazards of the unguarded "smooth" kelly bushing, they are either too speculative or remote to be considered significant.

If someone were to fall on the kelly bushing while it is rotating, death or serious physical injury could result. However, this is true whether the kelly bushing is rotating or not, and is attributable to the physical properties of the bushing, namely, that it is a heavy metal object. (Tr. 68, 76) While there is evidence in this case in the nature of opinion evidence that injuries resulting from a fall on a rotating kelly bushing would likely be more serious than a fall on a non-rotating kelly bushing, (Tr. 77) this opinion is unsupported by reasons and constitutes little more than speculation, particularly since the proponent of this opinion had no personal knowledge of such accidents, and did not disclose the nature of any resulting injuries even though he has heard of such accidents occurring. (Tr. 78-79)

Similarly, the evidence pertaining to the perceived hazard of clothing being caught in the kelly bushing is highly speculative. While there is opinion evidence that clothing can get caught in the kelly bushing, (Tr. 42) this evidence is unpersuasive in light of the other evidence in this record which describes experiments conducted with other "smooth" kelly bushings wherein attempts to catch objects in a rotating kelly bushing were unsuccessful. (Tr. 116, E. Tr. 337-338, 342, 452-457)

The fourth and final type of perceived hazard appears to be even more remote and, indeed, unrealistic. This is the hazard of stepping on the rotating rotary table and being thrown onto one of the nearby heavy objects. Since the compliance officer's own measurements show that the diameter of the rotary table is 30 inches and that of the kelly bushing is 24 inches, the exposed portion of the rotary table was only three inches on each side. For someone to step on that narrow an area and to put sufficient weight on that foot to then be thrown into the nearby pieces of equipment simply does not comport with reality. The more realistic view is that if one were to attempt to step on the rotary table, the rotational force of the rotary table would cause the foot to be brushed back in the direction of the rotation before sufficient weight could be placed on the foot that has stepped on the table to cause someone to be thrown about. (E. Tr. 404)

In evaluating the perceived hazards of a guarded kelly bushing, a distinction must be made between the two basic types of guards--the clamshell, removable type of guard and the bell-shaped guard such as the Varco guard depicted in C-22. It appears that the most feasible type for use on an oil rig is the latter. Indeed, the bell-shaped guard is the only manufactured guard available and is designed for use with the very type of Varco kelly bushing involved here.

Five of the perceived hazards associated with kelly bushing guards apply to these bell-shaped guards. Of these, two appear to be more illusory than real, while the other three appear to be significant. One of the perceived hazards associated with this type of guard is that of the tong lines becoming frayed by rubbing against the edges of the

bell-shaped guard while it is resting on top of the kelly bushing which, in turn, is placed in the rat hole.[*] Since the evidence establishes that it takes months for this fraying process to occur, (Tr. 124), it would appear that a modest maintenance program could be expected to prevent this perceived hazard from occurring. The perceived hazard of the bell-shaped kelly bushing guard deflecting the materials that come out of a well during a blowout also appears to be unrealistic if not illusory. The evidence here established that in the case of a blowout, the presence of a guard does not significantly increase the hazards associated with a blowout. (Tr. 103-104)

Three of the perceived hazards associate with bell-shaped kelly bushing guards appear significant. Two of these relate to the presence of the guard when the kelly bushing is being mated to the master bushing. During certain phases of drilling operations, the kelly bushing is disengaged from the master bushing to permit the addition or deletion of pipe from the drill stem. When this occurs, the guard rests on top of the kelly bushing, which is suspended from above by the kelly, which is attached to the traveling block. During this phase of the operation, that portion of the kelly bushing which is above the platform when it is in a drilling mode (the bowl) is covered by the bell-shaped guard. The sides of the guard extend beyond the sides of the bowl approximately six inches (Tr. 88) and the bottom of the guard extends below the bottom of the bowl a few inches. (C-22)

---

[*] The rat hole is a pipe which extends vertically from the drill floor to approximately head-high. The kelly bushing and, if used, the bell-shaped guard are placed on the top of this pipe during certain phases of drilling operations.

When the kelly bushing is put back into the drilling mode, it is necessary to physically guide by hand the kelly bushing so that it mates with the master bushing. The presence of this guard during this mating process substantially impedes the mating process and creates a hazard for those who are guiding the kelly bushing into place. First, the guard obstructs the vision of the employees who are guiding the bushing into place. (E. Tr. 524-530) Secondly, in order to guide it, the employees must position their hands under the guard with their view obstructed and risk the possibility of fingers or hands being amputated during this process. Indeed, the record shows that amputations have occurred in this situation. (E. Tr. 479)

It is possible to avoid this hazard by raising the guard from its resting place on top of the kelly bushing by attaching a line to the bushing, which suspends it overhead on the kelly. However, this presents a different hazard which is every bit as significant. The Varco guard, which weighs over 300 pounds, is hoisted by means of a catline. (Tr. 127) A catline is used for hoisting loads up to a thousand pounds. (Tr. 131) It is suspended from the top of the rig. (Tr. 127) It is primarily composed of a 1 1/2 inch thick rope, on the end of which is a chain. (Tr. 128) In order to hoist objects from the rig floor with the catline, the chain portion of the catline is looped around the object. (Tr. 127) However, because of the smooth surface of the Varco guard, it is difficult to wrap the chain around it, and there is a substantial likelihood that, once overhead, the guard will come loose from the chain and fall on the employees who are working immediately below. (Tr. 128)

The third and final significant hazard involved with the bell-shaped guard is also present in the case of the removable guards. The presence of the guard substantially obscures the visibility of the kelly bushing, when it is in a drilling mode and rotating. (E. Tr. 461) The evidence shows that visual contact with the kelly bushing when it is rotating is important in that production and the proper maintenance of the equipment is impeded if visibility is impeded. (E. Tr. 462) As a result of the latter, parts of the kelly bushing, such as bolts contained therein, can and do become loose and can create a significant hazard when the kelly bushing is then raised overhead. (E. Tr. 465-466, 530).

In comparing these hazards, it is apparent that there are serious hazards present whether the kelly bushing is guarded or not. Amputations and fatalities have occurred as a result of unguarded kelly bushings. Indeed, at least one amputation is attributable to a "smooth" kelly bushing that was unguarded. The same results have occurred because of the hazards associated with the most feasible forms of kelly bushing guards, namely, the bell-shaped guard. However, in this case, it appears that the hazards of a kelly bushing guard are greater than the hazards of the "smooth" kelly bushing unguarded because of the work rule adopted by respondent which would limit the severity of the injuries that can be expected to result from the unguarded "smooth" kelly bushing that is involved here.

This work rule provides:

> "At any time an employee's work activities require handling materials which can become entangled in the rotary table, the kelly bushing, or kelly, while such equipment is in motion, there shall be at the controls a person capable of stopping the rotating equipment." (C-23A)

This work rule is directed at what is by far the most significant hazard associated with an unguarded kelly bushing. Moreover, it, unlike a kelly bushing guard, also protects against the same hazard which is associated with the kelly. This work rule is directed not to the prevention of the entanglement hazard, but rather towards reducing the severity of the resulting injuries. The evidence establishes that the rotation of the kelly bushing, rotating at 70 rpm, can be stopped within one revolution. (Tr. 123) There is credible evidence this would substantially reduce the injuries that could be expected to occur in the event of entanglement. (Tr. 124) Because of this work rule, the injuries that could be expected to occur as a result of this unguarded, "smooth" kelly bushing on respondent's rig would appear to be substantially less severe than those which could be expected to occur as a result of the hazards associated with a kelly bushing guard.

It is parenthetically mentioned that complainant challenges this work rule as not being communicated. (Complainant's brief at 15.) The basis of this challenge is that it was not posted on the bulletin board at the rig during the inspection and that the existence of such work rule was not made known to the inspector at the time of the inspection. (Complainant's brief at 10-11) Inasmuch as it is not shown in this record that the compliance officer sought <u>all</u> the applicable work practices during the inspection, the failure of respondent's representatives to voluntarily make known to the inspector the existence of such work rule does not establish that it was not effectively communicated. Similarly, the fact that on a particular day the work rule was not posted does not establish that the work rule was not effectively communicated.

The record affirmatively shows that this work rule was distributed to respondent's employees by a memorandum dated February 27, 1980. (C-23) There is also affirmative evidence that this work rule accurately reflects respondent's policy. (Tr. 90, 123) This evidence is sufficient to establish a prima facie case that the work rule was effectively communicated, and such evidence is not refuted by the matters raised by complainant.

This work rule is not only relevant to establishing the first element of the greater hazard defense, it also establishes the second element as well. The evidence establishes that the full measure of protection contemplated by the standard cannot be provided by alternative means. (E. Tr. 472-476, 518-519) This work rule establishes that respondent took steps to provide some significant measure of protection to its employees even though the full measure of protection contemplated by this standard could not be provided. This is sufficient to establish the second element of the defense. See Harlock Roofing Co., 7 BNA OSHC 1867, 1979 CCH OSHD ¶24,006 (No. 14907, 1979).

To satisfy the third and final element of this defense, respondent argues that it could not comply with the variance procedure specified in 29 C.F.R. §1905.10. Further, respondent argues that it did not have any reason to believe that it was violating the standards. For these reasons, it is argued that making an application for a variance would have been inappropriate. Since the record establishes here that respondent did not have reason to believe that a kelly bushing guard was required, and inasmuch as it is not shown that respondent had actual knowledge of such requirement, it is found that it would be inappropriate for

respondent to have sought a variance. Diebold Inc. v. Marshall supra. Thus, it is found that respondent has established all three elements to the greater hazard defense.

ORDER

In view of the foregoing and pursuant to Fed. Civ. P. 52(a) which permits the entry of judgment based upon findings of fact and conclusions of law which appear in a decision, it is hereby ORDERED that:

1. Citation No. 1, Item No. 1, is VACATED.

2. Citation No. 2, Item No. 1, is VACATED.

3. Citation No. 2, Item No. 3, is AFFIRMED and no penalty is assessed.

Quentin P. McColgin
Judge, OSHRC

Dated: May 6, 1982

# OCCUPATIONAL SAFETY AND HEALTH REVIEW COMMISSION

## NOTICE OF DECISION

Secretary of Labor v. NOBLE DRILLING CORPORATION
OSHRC Docket No. 81-0770

1. Enclosed is a copy of my decision. It will be filed with the Commission on May 6, 1982, and will become the final order of the Commission on June 7, 1982, unless a Member of the Commission directs that it be reviewed.

2. You may petition for discretionary review of this decision by the Commission. A petition may be filed directly with me within twenty (20) days from the mailing of my decision. Thereafter, a petition should be mailed to the Executive Secretary, Attention:

   Chief Review Counsel
   Occupational Safety and Health Review Commission
   1825 K Street, N.W., Suite 601
   Washington, D.C. 20006.

   Any petition filed directly with the Commission will be considered to the extent that time and resources permit. The last day the Commission may consider your petition is June 7, 1982. This final order date is fixed by law and cannot be extended under any circumstances.

3. If review is ordered by a Member of the Commission, each party to this case will be notified. In addition, each party will be given an opportunity to submit a brief to the Commission.

4. Please complete the enclosed postcard indicating whether you presently intend to seek review of this decision and mail the completed card promptly. Your response does not bind you in any way, but it assists the Commission in processing your petition when it is filed.

5. For any further details on the review process, see Commission Rules 90, 91, 92, and 93.

Richard J. Murphy
Judge, OSHRC

## DECISION AND ORDER

RICHARD J. MURPHY, JUDGE

Respondent operates oil and gas well drilling rigs in numerous states including the State of Montana. On February 18, 1981, a compliance officer of the Occupational Safety and Health Administration

(OSHA) conducted an inspection of Respondent's Drill Rig 522 which was then in operation at a location near Sidney, Montana.[1/]

As a result of that inspection a citation was issued alleging in Citation 3 that Respondent was in serious violation of the Occupational Safety and Health Act of 1970 (29 U.S.C.651, et seq)(Act) in that rotating parts of the rotary table and kelly bushing on Rig 522 were not guarded as required by the standard set forth in 29 C.F.R.1910.212(a)(1). A fine of $800.00 was proposed.[2/] Respondent's answer is a general denial of the allegation of unlawfulness. No affirmative defenses are asserted in that answer.

This case was heard on December 1, 1981, by Judge Erwin L. Stuller. Subsequently it was reasigned to me because of the unavailability of Judge Stuller to this Commission. By order of February 23, 1982, I informed the parties of my intention to decide this case on the record made before Judge Stuller and on consideration of the post-hearing briefs filed by the parties. That Order directed the parties to file any objections to that proposed handling by March 17, 1982. No objection has been filed.

---

1/ Respondent stipulates that it was engaged in a business affecting commerce within the meaning of Section 3(5) of the Act and that this Commission has jurisdiction in this case. It is so found and concluded.

2/ Another citation was issued as a result of the Febuary 18, 1981 inspection but as it was not contested it is not at issue here.

Determination of whether the unguarded rotory table bushing and kelly bushing on Rig 522 violated the machine guarding standard in 29 C.F.R.1910.212(a)(1) requires an understanding of the location of those parts of the rig and their function.

The rotary table master bushing, kelly bushing and kelly are rotary components of a drilling rig. The top of the rotary table is approximately flush with the rig floor. The rotary bushing is a flat circular piece 3 feet in diameter which is exposed through the top of the rotary table. The kelly bushing rests on the rotary bushing. The kelly passes through the kelly bushing and rotary bushing to the drill string which consist of connected lengths of drill pipe with a bit or cutting head on the bottom end. During the drilling operation machinery under the rotary table causes the rotary bushing and the kelly bushing (which is engaged to the rotary bushing) to rotate. The circular action of the kelly bushing causes the kelly to turn and transmit rotary motion to the drill string. (Ex. 4 and 6)

The floor of Rig 522, which is the central to the drilling activity, is metal. It is approximately 32 feet square. A plan of that rig floor[3/] shows that the top of the rotary table is 6'2" x 7" and is located at the approximate center of the floor. Its top is slightly raised above the floor level. The rotary bushing is located in the center of the

---

3/ Respondent's Exhibit B

rotary table. There are various structures on or through the rig floor around the rotary table. On one side of the rotary table is a structure called the draw works which is 8'6" from the center hole of the kelly bushing (also 7' from the edge of the rotary bushing and 5' from the edge of the rotary table). On two other sides the center of the rotary bushing is approximately 8'8" from derrick legs On the fourth side, a "mousehole" is approximately 4' from the edge of the rotary bushing. The pipe rack is also on the mousehole side of the floor. A large part of the activity on the rig floor takes place in the area within a 8' radius of the center of the kelly bushing.[4/]

The parties stipulated that Rig 522 had been drilling at the Stanley, Montana, site for approximately 60 days before the OSHA inspection on February 18, 1981; that respondent employed five or six employees a tour (shift) for three tours a day; that the crews for each tour were composed of a derrickman, motorman, fireman, tool pusher and one or two floormen. The parties further stipulated that when the rig commenced drilling at the Stanley site it operated at 120 to 140 revolutions per minute (RPM) and that subsequently the normal drilling speeds ranged from 55 to 65 RPM.

---

4/ Mr. Hopkins, Safety Coordinator for Respondent, testified that the area on the drill rig floor between the draw works, pipe works and the two legs is considered the working area of the drill rig floor. (Tr. 113)

During the course of the inspection the OSHA compliance officer observed the drilling operation on Rig 522 for 35 to 45 minutes at which time the rig was operating at 65 RPM. The compliance officer observed employees working in the area of the rotary table. He testified that those employees came to "anywhere from several feet to within approximately a foot of the rotating kelly bushing at that time (Tr 12-13)."

The kelly bushing is a Varco type bushing that does not have bolts which protrude. It is shown in three photographs taken by the compliance officer and received in evidence. It has a rectangular base. It is irregularly shaped with indentations for rollers which press against the kelly. It has bolts in indentations on its surface. These photographs show a chain laying on the metal floor near the edge of the rotary table. The photographs also show mats laying on the derrick floor and the top of the rotary table which are within inches of the rotary bushing. Employees are shown in two of these pictures.

The compliance officer testified that at the time of the inspection the rig floor was wet and slippery. He testified that the unguarded kelly bushing presented hazard to the two to four workers he observed. The compliance officer testified that a worker could incur a minor injury or a serious injury causing death from contact with a rotating kelly bushing. He testified that a man could trip, slip or fall into the bushing, get his clothing or hair caught in the bushing. He also

testified that a spinning chain or the hose that is used to wash drill mud off the floor could become entangled in the rotating kelly bushing and cause injury. A copy of an employer's report to the State of Montana, Division of Worker's Compensation shows that a drill rig roughneck at Richland County, Montana, had both legs amputated as a result of an accident described as follows: "Employee was pulling out spinning chain in order that it could be wound up on the stand of pipe in the mousehole. Chain became entangled in kelly bushing, encircling employee's legs between chain and kelly." While the accident was on a different rig of a different employer and involved a different type of kelly bushing [5/] it's occurrence indicates how serious a kelly bushing accident can be.

The OSHA compliance officer testified that during the course of inspections of other oil and gas well drilling rigs he had observed guards on kelly bushings. Exhibit 13 is a picture of one type of such guard. The derrick man for Rig 522, called as a witness for Complainant, testified that his previous employer did not have kelly bushing guards

---

5/

The kelly bushing involved in the accident at Richland County which caused the double amputation is shown in Exhibit 14. It is smoother than the kelly bushing on Rig 522. Respondent's witness Hopkins testified that the kelly bushing shown in Exhibit 14 is similar to the Varco kelly bushing used on Rig 522 but that it has less indentations than the Varco bushing. (Tr 106-107)

on it's drilling rigs when he started working but did have such guards when he left the company. (Tr 72). He also testified that after each additional length of drill pipe is connected to the drill string, that is after each pipe connection, the surface of the platform is washed with a power hose and that in winter months the drill rig floor becomes icy and slippery. On cross examination the derrick man testified that "in the ordinary course of events while the kelly bushing is rotating, there's no job that requires a roughneck or any other member of the crew to be near that kelly bushing (Tr 68)."

Respondent presented three witnesses each of whom has been employed by it for 28 years or more. Each testified that during his long employment with Respondent he had never heard of an injury attributable to a kelly bushing. Witness Hopkins has been safety coordinator for respondent since 1970 and reviews all company accident reports. Each of these witnesses testified that no employee is required to perform any job or task on the kelly bushing while it is rotating, or to perform any task within two feet of the kelly bushing while it is in operation. Witness Hopkins testified on cross examination that activity in near proximity of a rotating mechanism is hazardous and defined near proximity as one to two feet (Tr 113). He acknowledged that employees walk from one side of the rig to the other during the drilling mode and come no closer than two feet of the rotating kelly bushing or rotating part of the table.

Respondents case is that an unguarded kelly bushing is not hazardous. On brief Respondent states that the sole issue in this case is "Is an 'unguarded' kelly bushing a hazard to employees on a drilling rig?" Respondent argues that there is no hazard because employees are not required to work within a "zone of danger" surrounding the kelly bushing on Rig 522. In support of this argument, Respondent relies on the testimony of it's long time employees that unguarded kelly bushings on its rigs had not caused accidents. Respondent also relies on a safety regulation of the Occupational Safety and Health Commission of the State of Wyoming which "does not require that a kelly bushing be guarded but rather relegates the safety requirement to certain work practices." (Respondent's brief P8)

I find that the record in this case proves the hazard of the unguarded kelly bushing and unguarded rotary bushing. Respondent's witness Hopkins, its safety coordinator, conceded that activity in the near proximity of a rotating mechanism is hazardous. The regulation of the State of Wyoming, which as stated by Respondent opts for a work practice regulation rather than a guard for kelly bushings, is a tacit recognition that a rotating kelly bushing is hazardous. The testimony of the OSHA compliance officer that an employee's clothes or hair could become entangled in a rotary kelly bushing or that chains or hoses used on the drilling floor could become entangled on the bushing and cause injury is persuasive. The pictures of the kelly

bushing introduced in evidence support that testimony. Moreover, that testimony as to serious hazard is confirmed by the accident described above which resulted in the amputation of two legs.

I further find that Respondent's employees had access to and therefore were exposed to the above described hazard. Respondents argument that there is no hazard is in part an argument that its employees are not required to work within a "zone of danger" surrounding the rotating kelly bushing, which Respondent's witness Hopkins defined as within two feet of the bushing. I find that a large part of the activity on the rig floor takes place within an eight foot radius of the center of the kelly bushing and within 6 feet of the outside edge of the rotary bushing. The compliance officer testified that he observed employees within several feet to within approximately a foot of the rotating kelly bushing. Witness Hopkins testified that employees walking from one side of the rig floor to the other side come no closer than two feet of the rotating kelly bushing. In view of the uncontested fact that employees work in the area from 2 to 8 feet from the rotating kelly bushing and considering the sometime slippery condition of the floors and the presence of chains and pads on the floor and irregularity in the floor surface, any one of which could cause slipping or tripping, I find that employees have access to and are exposed to the hazard. Secretary v. Brown-McKee, Inc., (1980) 8 BNA OHSC 1248, 1249.

I also find that guards are available. A picture of a kelly bushing guard is shown in Exhibit 13. Mr. Mitchel, derrick man for Respondent on Rig 522 testified that his last employer used guards on its kelly bushings. No evidence was presented to show that the kelly bushing cannot be guarded. Moreover I find that Respondent was aware of the hazard associated with unguarded kelly bushings and rotary bushings. Exhibits 10, 11 and 12, are copies of documents dated in 1976 from Respondent's files which deal with means of guarding kelly bushings to prevent hazard to employees.

I find that respondent's non-compliance with the guarding requirements of 29 C.F.R.1910.212(a)(1) is a serious violation of the Act as defined in Section 17(k) of the Act. The record and the foregoing findings clearly establish that an unguarded kelly bushing is hazardous, and demonstrate the possibility of an accident. The record also shows that in the event of such an accident there is a substantial probability of death or serious injury. Moreover respondent had sufficient knowledge of the hazard, the physical and operating conditions on the drill rig floor and of the availability of kelly bushing guards satisfy the knowledge requirement of Section 17(k).[6/]

---

6/ In Secretary v Hermitage Concrete Pipe Co., OSHRC Docket No. 4678, dec. March 23, 1982, 10 BNA OSHC _____, The Commission stated the requirements of Section 17(k) as follows:

> ". . . In order to establish a serious violation of the Act, the Secretary must establish that (1) death or serious physical harm could result if the standard is violated, and (2) that the employer has actual or constructive knowledge of the violative condition."

In making this determination I have not been unmindful of Respondents argument that the absense of kelly bushing accidents on its rigs for many many years disproves the existence of a hazard. However, the absence of injuries in the past does not relieve an employer of his duty under safety standards to prevent future injuries if, as here, there are hazards to which employees are exposed. Secretary v George C. Christopher & Son, Inc. (1982) 10 BNA OHRC 1436, 1446; Secretary v. A. E. Burgess Leather Company, Inc., (1977) 5 BNA OHRC 1096.

I have also considered Respondent's argument based on Fred Wilson Drilling Co. Inc. v. Marshall, 624 F. 2d 38 (5th Cir. 1980) in which the Court of Appeals set aside a final order which held that the unguarded kelly bushing on an oil rig violated 29 C.F.R. 1910.212(a)(1). The Court stated that:

> "In finding Fred Wilson in violation of this standard, the ALJ acknowledged that use of a kelly bushing guard would pose serious hazards, but concluded that an unguarded bushing, on balance, presented the more unsafe situation. . ."

The court in reviewing the record held that the evidence before the Commission did not support the Administrative Law Judge's finding that the greater hazard defense should fail. Thus that reversal, based on an analysis of the evidence in that case, does not provide a rule of law for this case, especially as in this case Respondent does not assert the affirmative defense that compliance with the standard would create a greater hazard than that against which the standard is directed.

Moreover, no evidence was offered by Respondent to demonstrate that it would be hazardous to guard the kelly bushing on Rig 522.

I find that the proposed penalty of $800.00 is appropriate as the factors to be considered pursuant to 17(j) of the Act are fully established on this record. Elements which have been considered in determining the gravity of the violation have been accounted for as two to four employees were exposed to the hazard per tour and Respondent was operating three tours; the duration of the exposure was the greater part of the eight hour tours; and no precautions were taken by respondent to minimize the employees' exposure to hazard.

## O R D E R

Based on the foregoing findings and conclusions it is ordered that Item 1 of Citation No. 3 issued to Respondent February 24, 1981, for violation of 29 C.F.R. 1910.36 (b)(1) is affirmed and a penalty of $800.00 is imposed.

Richard J. Murphy
Judge, OSHRC

# NOTICE OF DECISION

Secretary of Labor v. Texas Masonry, Inc.
OSHRC Docket NO. 81-0391

1. Enclosed is a copy of my decision. It will be filed with the Commission on May 17, 1982, and will become the final order of the Commission on June 16, 1982, unless a Member of the Commission directs that it be reviewed.

2. You may petition for discretionary review of this decision by the Commission. A petition may be filed directly with me within twenty (20) days from the mailing of my decision. Thereafter, a petition should be mailed to the Executive Secretary, Attention:

   Chief Review Counsel
   Occupational Safety and Health Review Commission
   1825 K Street, N.W., Suite 601
   Washington, D. C. 20006.

   Any petition filed directly with the Commission will be considered to the extent that time and resources permit. The last day the Commission may consider your petition is June 16, 1982. This final order date is fixed by law and cannot be extended under any circumstances.

3. If review is ordered by a Member of the Commission, each party to this case will be notified. In addition, each party will be given an opportunity to submit a brief to the Commission.

4. Please complete the enclosed portcard indicating whether you presently intend to seek review of this decision and mail the completed card promptly. Your response does not bind you in any way, but it assists the Commission in processing your petition when it is filed.

5. For any further details on the review process, see Commission Rules 90, 91, 92 and 93.

JUDGE'S DECISION MAY 17 '82

FINAL ORDER ON JUN 16 '82

DECISION AND ORDER

Appearances:

Jack Ostrander, Esq., and Anne F. Watson, Paralegal, of Dallas, Texas for the Complainant.

James D. Sprague, Safety Director, The Associated General Contractors of America, of Dallas, Texas for Respondent.

BOTKIN, Judge:

This is a proceeding brought before the Occupational Safety and Health Review Commission ("the Commission") pursuant to §10 of the Occupational Safety and Health Act of 1970, 29 U.S.C. 651 et seq. ("the Act"), contesting citations issued by the complainant, the Secretary of Labor ("the Secretary"), to the respondent, Texas Masonry, Inc. ("Texas"), under authority vested in the Secretary by §9(a) of the Act.

As a result of an inspection conducted during the period of December 4 through December 12, 1980, of a workplace located at 205 North Industrial, Bedford, Texas, where respondent's employees were engaged in the construction of a building, two citations were issued to respondent on January 22, 1981,

alleging violations of §5(a)(2) of the Act. The citations charged respondent with three serious and one nonserious violations for which a total penalty of $1,320.00 was sought.

Respondent timely filed notice of contest on February 3, 1981, commencing this proceeding before the Commission under §10(c) of the Act. Thereafter, a complaint and answer were filed with the Commission.

A hearing was held in this matter on August 21, 1981, in Dallas, Texas. No affected employees or representatives of affected employees participated in the proceeding. The matter is now ripe for decision.

## JURISDICTION

In its answer, respondent admitted that jurisdiction of the proceeding was conferred on the Commission by §10(c) of the Act. It also admitted that it has a place of business and office located at 3517 Dividend, Garland, Texas. It denied that it is an employer engaged in a business affecting commerce who has employees within the meaning of §3(5) of the Act. However, at the hearing, respondent stipulated that it is an employer within the meaning of §3(5) of the Act (Tr. 3). Therefore, no issue remains in regard to jurisdiction.

## MOTION

At the hearing, complainant moved to withdraw item 1 of serious citation 1 (Tr. 3). A ruling was not entered at that time. Complainant's motion is hereby granted.

## ISSUES

1. Whether respondent was in serious violation of 29 CFR 1926.451(d)(7),

and, if so, the appropriate penalty therefor.

2. Whether respondent was in serious violation of 29 CFR 1926.451(d)(10), and, if so, the appropriate penalty therefor.

3. Whether respondent was in nonserious violation of 29 CFR 1926.152(a)(1) and, if so, the appropriate penalty therefor.

## PARTIAL RESOLUTION OF THE FACTS

John T. Sayers, a compliance officer ("the CO") for the Occupational Safety and Health Administration ("OSHA"), conducted the inspection (Tr. 5,7). He has been a compliance officer with OSHA for approximately seven years (Tr. 6-7). Prior thereto, he spent 30 years with fire departments of various military branches of the federal government where he inspected for hazards involving fire, electricity, safety and building stress. His duties also involved inspection of all buildings under construction at his various duty stations (Tr. 6).

During the period of December 4 to December 12, 1980, the CO and another compliance officer conducted an inspection of a workplace at the northwest corner of I-20 in Bedford, Texas, where a department store was under construction.[1] Respondent was one of the subcontractors inspected by the CO (Tr. 7, 33-34). Respondent's representative at the opening conference was a foreman who accompanied the CO during most of the inspection (Tr. 8, 9). Respondent's employees were engaged in masonry work at the workplace (Tr. 8).

---

1 The specific location set forth in the citation was 205 North Industrial, Bedford, Texas.

Cliff Johnston ("Johnston") had been vice-president of respondent for approximately three months prior to the date of the hearing (Tr. 41, 43-44). In that position, he is charged with responsibility for field operations and the estimating and financial departments (Tr. 41). Prior thereto, he was general manager (Tr. 43-44). At the time of the hearing, his total length of employment with respondent was approximately 14 months (Tr. 46, 47-48). He is the holder of a master's degree in mechanical engineering. While pursuing his education, he worked for a consulting engineer. Prior to joining the respondent, he had 16 years of experience as a design engineer in the aerospace industry (Tr. 44).

Douglas J. Perrin ("Perrin") has been employed in the construction business for 27 years. He commenced work as a laborer for bricklayers, then became a mason, and ultimately became a supervisor (Tr. 49). He had been a foreman until approximately four months prior to the inspection, when he became field superintendent for respondent (Tr. 48, 53). His duties as field superintendent include scheduling jobs, making sure that foremen on jobs have the necessary personnel and equipment, assisting foremen solve problems in the field, insuring that worksites are in compliance with OSHA standards through directives to his foremen, and communications between the field and Johnston and the home office (Tr. 48-49, 53-54). His routine involves going to the office in the morning, taking calls from foremen, and then dispatching or filling various requests by the foremen. Thereafter, he makes routine visits to various jobsites to help solve problems or program the work (Tr. 53). In this job capacity, he keeps abreast of safety requirements of OSHA as they apply to worksites. He has been concerned and interested in OSHA requirements since the Act became effective (Tr. 53).

Respondent's safety program has been in effect for a number of years. It is established by written directive. Management thereof flows from upper management to the superintendent, then through the foremen to workers by way of weekly safety meetings on each job. Written reports of those meetings are compiled and maintained. There is also a monthly meeting of foremen where safety and other topics are discussed (Tr. 41-42, 45). Additionally, respondent's insurance carrier performs periodic inspections of various worksites on a random selection basis, furnishing written reports thereof to respondent (Tr. 45). The results thereof and a good safety record have yielded several letters of commendation from safety inspectors (engineers) for said insurance carrier and reasonably low insurance rates (Tr. 42). There have not been any recent job-related accidents of a serious nature (Tr. 42-43). Respondent is an associate member of The Associated General Contractors of America, a type of membership for subcontractors (Tr. 44-45). Since 1975, respondent has been inspected by OSHA on at least three occasions, including the current inspection (Tr. 45-46, 54-55). No citations were issued as a result of one inspection. During another inspection which took place in the late spring or early summer of 1980, a citation was issued for not maintaining eyewash and clean water beside a bucket of brick cleaner (Tr. 55).

(A) 29 CFR 1926.451(d)(7)- Securing of Scaffold Issue

Item 2 of serious citation 1 alleges a violation of 29 CFR 1926.451(d)(7) as follows:

29 CFR 1926.451(d)(7): Tubular welded frame scaffold(s) were not secured to the building or structure at least every 30 feet horizontally:

Scaffolds approximately 24 feet high and 231 feet long--North and South walls.

The cited standard provides:

§1926.451 Scaffolding.

* * *

(d) Tubular welded frame scaffolds

* * *

(7) To prevent movement, the scaffold shall be secured to the building or structure at intervals not to exceed 30 feet horizontally and 26 feet vertically.

Many of the underlying facts related to this citation are not in dispute. The north and south walls of the building were under construction on the date that respondent was inspected. Respondent had 32 employees on the project (Tr. 11). For approximately 1 1/2 to 2 hours, the CO observed approximately 20-25 employees performing work from scaffolds while installing masonry blocks to form those walls (Tr. 11-13, 20). One half of that crew (20-25) was working on each wall (Tr. 11). The scaffolds were not secured to the walls (Tr. 9, 10, 14). Measurements by the CO revealed that a section of scaffolding was six feet tall, seven feet long and five feet wide (Tr. 10, 19). Although the frames of the scaffolds are five feet wide, there is a side bracket, which is approximately 24 inches wide, on which masons walk along the walls. Therefore,

the width of the scaffolds, including side brackets, from the interior (side closest to the wall) to the exterior of the scaffolds is approximately seven feet (Tr. 59).[2] There were 31 sections (217 feet) of scaffolds on the south wall and 33 sections (231 feet) thereof on the north wall, lengthwise or horizontal; and they were three sections (18 feet) and four sections (24 feet) in height (Tr. 10, 19; 10, 18-19). There was debris on the ground underneath and also adjacent to the exterior side of the scaffolds. It was composed of masonry blocks, pieces of masonry blocks, lumber and other unidentified materials (Tr. 13, Exs. C-1 and C-2).[3] The scaffolding had good footing, was on level ground and had a good base under it. Scaffold frames were aligned and X-braced (Tr. 49).

The first issue to be resolved involves an interpretation of the standard. The decisive question is whether the cited standard applies to scaffolding which exceeds 30 feet in length, but does not reach 26 feet in height. Based on training and instructions, the CO interprets the standard to require scaffolds to be secured to a building or structure at both (i) vertical intervals not to exceed 26 feet, and (ii) horizontal intervals not to exceed 30 feet (Tr. 35).[4] Cross-examination of the CO by respondent appears to reveal that its position

---

2 No evidence was introduced as to whether the side brackets were level with scaffold platforms.

3 Exhibits C-1 and/or C-2 appear to show some lumber, bags of material (presumably cement) and unbroken masonry blocks in the area of the scaffolding.

4 Since the scaffold did not reach 26 feet in height at any place, the citation was based on a lack of securing it at intervals not exceeding 30 feet in length (Citation, Tr. 34-36).

is that a scaffold need not be secured unless it has reached both proportions, 26 feet vertically and 30 feet horizontally (Tr. 34-35). Johnston testified that it has been respondent's standard procedure to tie off the scaffolding when it reaches 26 feet in height. Although it may be done by some firms, he had never seen anyone tie off a scaffold that is six feet high and 35 feet long (Tr. 43).[5] His personal interpretation of the standard was formed during or after the early fall of 1980 (Tr. 46-47). In the context of an interpretation of the standard for purposes of respondent's work, Perrin's answer is somewhat different. He stated that a scaffold must be tied off at 30 feet horizontally and 26 feet vertically, when it reaches 26 feet in height and is going higher (Tr. 52).[6] In terms of tiers of scaffolding (vertical), tying off would begin on the fifth tier of scaffolds (Tr. 52).[7] In response to the question of whether height or length of scaffolds is the determining factor of when to secure, he responded that height is more so than length (Tr. 49-50).

I agree with the Secretary.[8] While the standard could have been written in more precise English, its meaning is far from ambiguous. The illogic of a

---

5 Also, see page 46 of the transcript. Thus, his testimony seems to give total deference to height.

6 This statement assumes a length of 30 feet. Also, see his testimony in more general terms relating to vertical heights of scaffolds at page 49 of the transcript.

7 Each tier is six feet tall (Tr. 10, 19).

8 However, the Secretary's introduction of that portion of the Manual of Accident Prevention in Construction, relating to tubular steel scaffolding (§14-2.7), issued by The Associated General Contractors of America, has not been persuasive (Ex. C-3). It does not support the Secretary's contention. It refers to height and width, not length. Testimony relating thereto can be found at pages 54-59 of the transcript.

contention that both vertical and horizontal elements of the standard must be met prior to an application of the standard can easily be seen. This would permit a contractor to erect and work from unsecured scaffolding 100 feet high if it was not 30 feet long.[9] I further find that a scaffold's length has some effect on its stability regardless of its height.[10] As aforesaid, the dimensions of the scaffolding were 217 feet in length on the south wall and 231 feet on the north wall, with its height varying from 18 to 24 feet (Tr. 10, 19;10, 18-19). The scaffolds were not secured to the walls and employees were working on them at heights of 18 and 24 feet (Tr. 9, 10, 14; 16, 18-19, 36, Exs. C-1 and C-2). The standard applies to the cited condition and the terms of the standard have not been met. Therefore, the existence of the hazard has been established.[11] Broadly stated, this standard is designed to protect workers from hazards related to the instability of scaffolds. More specifically, a movement of the scaffolding could cause the scaffolding together with work materials and workers to fall,

---

9 Based on Johnston's testimony, I realize that respondent does not follow such a practice (Tr. 43).

10 In so holding, I have not overlooked Johnston's assertion that he has never seen a scaffold tied off which is six feet high and 35 feet long (Tr. 43). However, his experience in the construction business is limited (Tr. 44-48). Such a height would certainly be a factor in determining the character of a violation (serious, nonserious, or de minimis). I agree with Perrin that height is a more important factor than length (Tr. 49-50). However, that is reflected in the standard itself by the different footage set forth.

11 See Pratt & Whitney Aircraft, 81 OSAHRC 39/A2, 9 BNA OSHC 1653, 1981 CCH OSHD ¶25,359(No. 13401, 1981), appeal withdrawn, No. 81-4104 (2nd Cir. August 3, 1981), and cases cited in that decision for a discussion of this type of standard where a hazard is presumed.

or workers to fall from the scaffolding (even if the scaffolding did not fall).[12]

In order to establish a serious violation of the Act, the Secretary must establish that (i) there is a substantial probability that death or serious physical harm could result if an accident occurred, and (ii) the employer has actual or constructive knowledge of the violative condition. The probability of an accident occurring is irrelevant. See Niagara Mohawk Power Corp., 79 OSAHRC 36/A2, 7 BNA OSHC 1447, 1979 CCH OSHD ¶23,670 (No. 76-2414, 1979). Here, respondent does not argue that it lacked knowledge of the violative condition, rather that the standard does not apply. Moreover, respondent had a foreman on the jobsite at the time of the inspection and its superintendent had been there on the same date, prior to the inception of the inspection (Tr. 8, 9). The violative condition was readily discoverable by sight if either of them had exercised reasonable diligence. Therefore, the requisite knowledge was present. It is well established that a supervisor's knowledge is imputable to an employer. Wander Iron Works, 80 OSAHRC 40/A2, 8 BNA OSHC 1354, 1980 CCH OSHD ¶24,457 (No. 76-3105, 1980). If an accident occurred, the CO testified that the probability of

---

12 The CO expressed the hazard in terms of the scaffold falling if overloaded (Tr. 12). Undoubtedly, the distribution of weight (men and supplies) would be a prime factor in causing unsecured scaffolding to fall. Other factors, apparently not present in this case, might be unevenness of the ground or high gusts of wind. Statements by Perrin that the scaffolding was safe in that it (i) had good footing, (ii) was on level ground, (iii) had a good base underneath it, and (iv) had frames aligned and X-braced, has not been ignored (Tr. 49, 50). However, this standard does not speak in terms of equivalence. While those factors might reduce the possibility of an accident, they do not eliminate it. They are properly considered in assessing the gravity of the violation for penalty purposes.

death or serious physical injuries resulting therefrom were "...pretty good... medium and above..." (Tr. 13). In so stating, the CO took into consideration such factors as (i) scaffolds, men and work materials falling 18 to 24 feet, and (ii) the debris or rubble in the vicinity of the scaffolding (Tr. 12-13). I find it obvious that, if an accident occurred, there was a substantial probability that the result thereof could be death or serious physical harm. Furthermore, I make the finding not only in regard to workers on the scaffolding, but also to those workers on the ground in near proximity thereto.[13]

Unrebutted testimony by the CO reveals that abatement in this case, securing the scaffolding to the walls at least every 30 feet horizontally, could have been achieved by placing a heavy wire, or an eyebolt with a connected chain, into mortar between the masonry blocks, either of which is tied to the scaffolding after the mortar has hardened (Tr. 14-16). I so find.

In assessing a proposed penalty of $420.00, the CO stated that the factors considered were the employer's size, good faith and history of previous violations. He did not mention the other statutory criterion under §17(j) of the Act, the gravity of the violation (Tr. 23-25).[14] However, the elements thereof can be gleaned from his other testimony (Tr. 11, 14-15, 13-14). The penalty

---

13 Exhibit C-2 reveals workers on the ground where scaffolding, men and supplies could strike them if an accident occurred.

14 Elements to be considered in determining gravity include the number of employees exposed to the risk of injury, duration of the exposure, precautions against injury, and the degree of probability of occurrence of an injury. National Realty & Construction Co., Inc., 72 OSAHRC 9/A2, 1 BNA OSHC 1049, 1971-73 CCH OSHD ¶15,188 (No. 85, 1972), rev'd on other grounds, 489 F.2d 1257 (D.C. Cir., 1973).

recommended by the complainant has been fully considered. However, the Commission is not bound to follow complainant's recommendations. Nacirema Operating Co., 1 OSAHRC 33, 1 BNA OSHC 1001, 1971-73 CCH OSHD ¶15,032 (1972). In light of the record and the statutory penalty criteria set forth in §17(j) of the Act, I conclude that a penalty of $200.00 is reasonable and appropriate.

## FINDINGS OF FACT

The evidence of record having been considered and evaluated in its entirety, the following facts are specifically found:

1. To avoid repetition, those facts set forth (i) under the headings entitled JURISDICTION and PARTIAL RESOLUTION OF THE FACTS, and (ii) those undisputed facts set forth in the third paragraph of the foregoing discussion of item 2 of serious citation 1 (immediately following a recital of the standard), are hereby incorporated by reference to the extent that they are not set forth hereunder.

2. During the period of December 4 to December 12, 1980, an inspection was conducted by compliance officers of OSHA of a workplace located at 205 North Industrial (the northwest corner of I-20), Bedford, Texas, where a department store was under construction.

3. Respondent, whose employees were engaged in masonry work at that location, was one of the subcontractors inspected by the CO.

4. The north and south walls of the building were under construction on the date that respondent was inspected. Approximately 20-25 of respondents employees were working from scaffolds while installing masonry blocks to form those walls. One half of that crew was working on each wall.

5. Each section of the scaffolding was six feet tall, seven feet long and five feet wide. Although the frames of the scaffolds were five feet wide, there was a side bracket, approximately 24 inches wide, on which masons walked along the walls. Therefore, the width of the scaffolding was approximately seven feet from the interior to the exterior sides thereof.

6. There were 31 sections (217 feet) of scaffolds on the south wall and 33 sections (231 feet) of scaffolds on the north wall, lengthwise or horizontal. They were three sections (18 feet) and four sections (24 feet) in height.

7. There was debris on the ground underneath and also adjacent to the exterior side of the scaffolds. It was composed of masonry blocks, pieces of masonry blocks, lumber and other unidentified materials.

8. The scaffolding had good footing, was on level ground and had a good base under it. Scaffold frames were aligned and X-braced.

9. The scaffolding was not secured to the walls at intervals not exceeding 30 feet horizontally.

10. Employees were working on the scaffolds at heights of 18 and 24 feet.

11. The employees were not protected from hazards related to the instability of scaffolds. A movement of the scaffolding could cause the scaffolding, together with work materials and workers, to fall, or workers to fall from the scaffolding (even if the scaffolding did not fall). Uneven distribution of weight (men and supplies) would be a prime factor in causing unsecured scaffolding to fall.

12. Respondent's supervisors knew or, with the exercise of reasonable diligence, could have known of the hazard (created by the work conditions described in findings of fact nos. 4 through 10) described in finding no. 11 hereof.

13. If an accident occurred as a result of respondent's failure to secure the scaffolding, there was a substantial probability that death or serious physical harm could result therefrom.

14. Respondent was in serious violation of §29 CFR 1926.451(d)(7).

15. The appropriate penalty is $200.00.

(B) 29 CFR 1926.451(d)(10) - Guardrails and Toeboards Issue

Item 3 of serious citation 1 alleges a violation of 29 CFR 1926.451(d)(10) as follows:

> 29 CFR 1926.451(d)(10): Standard guardrails and toeboards were not installed at all open sides and ends on tubular welded frame scaffolds more than 10 feet above the ground or floor:
>
> > Tubular welded frame scaffold--no guard rails on work platform--North exterior wall scaffold and South exterior wall scaffold.

The cited standard provides:

> §1926.451 Scaffolding.
>
> * * *
>
> (d) Tubular welded frame scaffolds.
>
> * * *
>
> (10) Guardrails made of lumber, not less than 2x4 inches (or other material providing equivalent protection), and approximately 42 inches high, with a midrail of 1x6 inch lumber (or other material providing equivalent protection), and toeboards, shall be installed at all open sides and ends on all scaffolds more than 10 feet above the ground or floor. Toeboards shall be a minimum of 4 inches in height. Wire mesh shall be installed in accordance with paragraph (a)(6) of this section.

The scaffolding is the same as that involved in item 2 of serious citation 1 (Tr. 16, 19). Additionally, the same workmen were involved at the identical time (Tr. 20). Therefore, the undisputed facts set forth in the third paragraph of the discussion of item 2 of serious citation 1 (immediately following the recital of the standard involved therein) are incorporated herein by reference.

The objective of this standard is (i) to protect workers from the hazard of falls from the sides and ends of scaffolds which are more than ten feet above the ground and, (ii) to protect workers on the ground in the area of such scaffolding from the hazard of falling objects, i.e., tools and work materials. The CO testified that there were no standard guardrails or toeboards in use on the scaffolds (Tr. 16, 18, 32, 36). I find his testimony persuasive. Moreover, two photographs support that assertion (Exs. C-1 and C-2).[15] In so finding, I have not overlooked Perrin's statement that he believed that a toprail and mid-rail were installed at a location where work had been completed (Tr. 50). I interpret the CO's statement to mean an absence of standard guardrails where work was actually being performed. The photographs do reveal X-bracing along both the interior and exterior sides of the scaffolding.[16] The evidence does not establish the dimensions of the X-braces or where the diagonal bars cross. While they may

---

15 I make this finding despite Perrin's testimony regarding (i) the posts and the one lone "rail" shown in Ex.C-1, and (ii) respondent's intentions to install guardrails (Tr. 50-52). The CO had been there for 1 1/2 to 2 hours observing this violation (Tr. 20). At some time later, respondent started putting up "rods used for expresses" for toprails (Tr. 22).

16 No evidence was introduced as to the distance between the interior side of the scaffold, or the side bracket attached thereto, and the wall. Therefore, a fall hazard was not established for the interior side of the scaffold.

provide some protection, the pictures clearly reveal that they do not constitute a satisfactory substitute for a midrail on the exterior side of the scaffolding.[17] I find that the exterior sides and ends of the scaffolding were "open" within the meaning of the standard. As aforesaid, Perrin believed there were guardrails at a location where work had been completed (Tr. 50). Apparently, these are the rods mentioned by the CO, who did not believe they created a standard guardrail (Tr. 22). Since they were not up where work was being performed, the questions of whether (i) they were at the proper heights, and (ii) were constructed of material providing equivalent protection, are moot. At any rate, they were not sufficiently described for respondent to meet its burden of establishing that they were constructed from "other material providing equivalent protection." See Dick Corporation, 79 OSAHRC 101/E8, 7 BNA OSHC 1951, 1979 CCH OSHD ¶24,078 (No. 16193, 1979).

Approximately 20-25 employees were engaged in work activities on said scaffolding at levels of 18 and 24 feet (Tr. 10-13, 18-20). The CO felt that workers were exposed to falls of 18 to 24 feet (Tr. 20-21). I agree. He noted that (i) most of the time, workers are in the center of the scaffolding, (ii) the scaffolding is five feet wide, and (iii) they are only two feet away from the edge should they make a mistake or misstep (Tr. 20-21). However, the CO apparently overlooked the fact that the side bracket on the interior of the wall is 24 inches wide. Therefore, the width of the scaffolds from interior to exterior is approximately seven feet (Tr. 59). As previously noted, no evidence

---

17 Moreover, by virtue of their configuration alone, X-bracing could not provide the protection accomplished by both a toprail and midrail.

was introduced on whether the side bracket was level with the scaffold platform. I presume that masons work off of the side bracket while actually building the walls. However, at times, they would be near the unguarded exterior of the scaffolding (preparatory to dismounting the platform or after mounting the platform). Moreover, the photographs reveal that work supplies stored on the platform would, at times, draw either masons or their helpers close to the center or near the edge of the exterior side of the scaffold (Ex. C-1 and C-2).

The evidence reveals that there was debris on the ground adjacent to the exterior side of the scaffolding. It was composed of masonry blocks or pieces thereof, lumber and other unidentified materials (Tr. 13, Exs. C-1 and C-2). I find that, if an accident occurred (a fall from the scaffold at either height, or objects such as tools or work materials fell and struck workers on the ground), there was a substantial probability that the result thereof could be death or serious physical harm.[18] This violative condition was also readily discoverable by sight if either the foreman or superintendent had exercised reasonable diligence. Therefore, the requisite knowledge was present and is imputed to respondent.

The CO's testimony regarding the factors considered in assessing a proposed penalty of $480.00 has been fully considered (Tr. 23-25).[19] In light of the record and the statutory penalty criteria set forth in §17(j) of the Act, I conclude that a penalty of $220.00 is reasonable and appropriate.

---

18 In effect, the CO so testified (Tr. 21).

19 Also, see Tr. 11, 13-15.

## FINDINGS OF FACT

The evidence of record having been considered and evaluated in its entirety, the following facts are specifically found:

1. To avoid repetition, those facts set forth (i) under the headings entitled JURISDICTION and PARTIAL RESOLUTION OF THE FACTS, and (ii) those undisputed facts set forth in the third paragraph of the discussion of item 2 of serious citation 1 (immediately following the recital of the standard involved therein) are hereby incorporated by reference to the extent that they are not set forth hereunder.

2. The OSHA inspection in December 1980 disclosed that approximately 20-25 of respondent's employees were working on scaffolds installing masonry blocks to form the north and south walls of a building under construction. One half of said crew was working on each wall.

3. The employees were working on the scaffolding at heights of 18 and 24 feet.

4. The scaffolds were not equiped with standard guardrails, lacking toprails, midrails and toeboards.

5. There was X-bracing along both the interior and exterior sides of the scaffolding.

6. While the X-bracing provided some protection, it did not provide a satisfactory substitute for a midrail on the exterior side of the scaffolding.

7. The exterior side and the ends of the scaffolding were open within the meaning of §29 CFR 1926.451(d)(10).

8. There was debris on the ground adjacent to the exterior side of the scaffolding composed of masonry blocks or pieces thereof, lumber and other

unidentified work materials.

9. The evidence does not establish that a fall hazard existed on the interior side of the scaffolding (side closest to the wall).

10. Approximately 20-25 workers on the scaffolding were exposed to the hazard of falls, ranging from 18 to 24 feet, off of the exterior side and the ends of the scaffolding.

11. Other workers on the ground adjacent to the exterior side and the ends of said scaffolding were exposed to the hazard of falling objects, i.e., tools and materials.

12. The exposure to said fall hazard would occur when workers were near the ends or exterior side of the scaffolding (mounting and dismounting the platform) and, at times, when they were near the center or close to the edge of the exterior side of the scaffolding while obtaining work materials.

13. If an accident occurred (a fall from the scaffold at either height, or objects such as tools or work materials fell and struck workers on the ground), there was a substantial probability that death or serious physical harm could result therefrom.

14. Respondent's supervisors knew or, with the exercise of reasonable diligence, could have known of the hazards (created by the work conditions described in findings of fact nos. 2-8) described in finding of facts nos. 10-12.

15. Respondent was in serious violation of §29 CFR 1926.451(d)(10).

16. The appropriate penalty is $220.00.

## (C) 29 CFR 1926.152(a)(1)-- Safety Can Issue

Item 1 of nonserious citation 2 alleges a violation of 29 CFR 1926.152 (a)(1) as follows:

> 29 CFR 1926.152(a)(1): Containers other than approved metal safety cans were used for the handling and use of flammable liquids in quantities greater than one gallon:
>
> > Five gallon can containing gasoline used to refuel 3 mortar mixer engines.

The cited standard provides:

> §1926.152 Flammable and combustible liquids.
>
> > (a) General requirements. (1) Only approved containers and portable tanks shall be used for storage and handling of flammable and combustible liquids. Approved metal safety cans shall be used for the handling and use of flammable liquids in quantities greater than one gallon, except that this shall not apply to those flammable liquid materials which are highly viscid (extremely hard to pour), which may be used and handled in original shipping containers. For quantities of one gallon or less, only the original container or approved metal safety cans shall be used for storage, use, and handling of flammable liquids.

Applicable definitions in 29 CFR 1926.155 are as follows:

> §1926.155 Definitions applicable to this subpart.
>
> > (a) "Approved", for the purpose of this subpart, means equipment that has been listed or approved by a nationally recognized testing laboratory such as Factory Mutual Engineering Corp., or Underwriters' Laboratories, Inc., or Federal agencies such as Bureau of Mines, or U.S. Coast Guard, which issue approvals for such equipment.

(b) "Closed container" means a container so sealed by means of a lid or other device that neither liquid nor vapor will escape from it at ordinary temperatures.

(c) "Combustible liquids" mean any liquid having a flash point at or above 140° F. (60° C.), and below 200° F. (93.4° C.).

* * *

(h) "Flammable liquids" means any liquid having a flash point below 140° F. and having a vapor pressure not exceeding 40 pounds per square inch (absolute) at 100° F.

* * *

(i) "Flash point" of the liquid means the temperature at which it gives off vapor sufficient to form an ignitable mixture with the air near the surface of the liquid or within the vessel used as determined by appropriate test procedure and apparatus as specified below.

* * *

(l) "Safety can" means an approved closed container, of not more than 5 gallons capacity, having a flash-arresting screen, spring-closing lid and spout cover and so designed that it will safely relieve internal pressure when subjected to fire exposure.

There were gasoline powered engines used at three separate mud-mixing areas on the jobsite.[20] Gasoline used to power the engines was in five gallon

---

20 The only evidence introduced by the parties relating to this citation was the testimony of the CO. Therefore, his testimony went completely unchallenged except for cross-examination.

cans.[21] Two of the cans were plastic and the other was a metal can without lids (Tr. 26). The CO observed one employee using a container to refuel an engine (Tr. 28-30). By lifting the can, the CO determined that it was over one half full of gasoline (Tr. 38).

As pertinent hereto, this standard is designed to prevent the ignition of flammable liquids while being handled or used by workers. Equally important, it seeks to contain the spread of fire if ignition takes place. Here, the terms of the standard have not been met by any of the three cans, since two were made of plastic, rather than metal, and the metal can contained no lids whatsoever. I agree with the CO that metal cans with removable caps (lids that screw onto the can) do not satisfy the standard (Tr. 27-28). It calls for a spring-closing lid. A spring-closing lid is opened by pressing on the handle and closed by removing that pressure (Tr. 27). Moreover, it cannot be reasonably questioned that gasoline is a flammable liquid (Tr. 28).

Uncontraverted testimony by the CO reveals that (i) as gasoline is poured from a can, vapors are released, and (ii) as those vapors mix with oxygen, the chances of explosion (ignition) increase (Tr. 30). He further stated that, should a workman spill gasoline onto the hot metal parts of an engine, a flash fire could erupt.[22] Under such a circumstance (flash fire), a worker could by simple reflex action release the pressure on the handle of a spring-closing lid, thereby closing the gasoline can. If he dropped the can, the gasoline would

---

21 The CO determined the cans contained gasoline (i) by smell, and (ii) by deduction, since they were being used to refuel gasoline engines (Tr. 28-30).

22 This was admitted by respondent during cross-examination (Tr. 39).

not spill out onto or near his feet, eliminating the possibility of standing in a blazing pool of gasoline (Tr. 27, 39).[23] Approved metal safety cans are available at area supply houses (Tr. 32).

I find it patently clear that the terms of the standard were not met. Therefore, a worker was exposed to the hazard that said gasoline, a flammable liquid, might ignite and, if so, that it would not be contained.

The respondent was charged with a nonserious violation. Based on the same factors set forth and discussed in regard to serious violations of citation 1, I find that respondent possessed the requisite knowledge. Other testimony by the CO reveals that, if an accident occurred, there was a substantial probability that death or serious physical injury could result therefrom (Tr. 30). However, this record does not convince me that the issue of a serious violation was tried either by express or implied consent. I find that the violative condition did bear a direct and immediate relationship to employee safety and health. Therefore, a nonserious violation was established. No penalty was proposed, and none will be assessed.

## FINDINGS OF FACT

The evidence of record having been considered and evaluated in its entirety, the following facts are specifically found:

---

23 The CO also testified that, if fire had traveled inside the can, then a worker could, by releasing pressure on the spring-closing lid, shut off its source of oxygen (Tr. 27). Unquestionably, that is true. However, it appears that the purpose of a flash-arresting screen is to prevent fire from entering a can. Accordingly, I discount this part of the CO's testimony since the record is silent on whether the cans lacked flash-arresting screens.

1. To avoid repetition, those facts set forth under the headings entitled JURISDICTION and PARTIAL RESOLUTION OF THE FACTS are hereby incorporated by reference to the extent that they are not set forth hereunder.

2. The OSHA inspection in December 1980 revealed that respondent used gasoline powered engines on the jobsite.

3. Gasoline is a flammable liquid.

4. Five gallon cans were used to carry the gasoline to the engines for refueling purposes.

5. Two of the cans were plastic and the other was a metal can without lids.

6. The cans were not approved metal safety cans, as required by 29 CFR 1926.152(a)(1), in that two cans were made of plastic and the third can lacked a spring-closing lid.

7. A spring-closing lid is opened by pressing on the handle and closed by removing that pressure.

8. The worker, who refueled the engines, was exposed to a hazard of the gasoline igniting.

9. If the worker spilled gasoline on hot engine parts while refueling the engines, a flash fire could erupt.

10. Under the circumstances set forth in finding of fact no. 9 hereof and if there was a spring-closing lid on the can, a worker could close the can by simply releasing the pressure on the handle of the can.

11. In the circumstances set forth in findings of fact nos. 9 and 10, this would prevent gasoline from spilling on or near the worker's feet if he dropped the can.

12. Respondent's supervisors knew or, with the exercise of reasonable diligence, could have known of the hazard created by the above-described work conditions.

13. The violative condition did bear a direct and immediate relationship to employee safety and health.

14. Respondent is in nonserious violation of 29 CFR 1926.152(a)(1).

15. A penalty is not warranted by the facts.

## CONCLUSIONS OF LAW

1. At all times material hereto, respondent was an employer within the meaning of §3(5) of the Act, engaged in a business affecting commerce, and having employees.

2. The Commission has jurisdiction over the parties and the subject matter of the proceeding.

3. Respondent was in serious violation of 29 CFR 1926.451(d)(7).

4. Respondent was in serious violation of 29 CFR 1926.451(d)(10).

5. Respondent was in nonserious violation of 29 CFR 1926.152(a)(1).

## ORDER

Upon the basis of the foregoing findings of fact, conclusions of law, and the record as a whole, it is ORDERED that:

1. Item 1 of citation 1, alleging a serious violation of 29 CFR 1926.451 (a)(13), is VACATED.

2. Item 2 of citation 1, alleging a serious violation of 29 CFR 1926.451 (d)(7), is AFFIRMED, and a civil penalty of $200.00 is ASSESSED.

3. Item 3 of citation 1, alleging a serious violation of 29 CFR 1926.451 (d)(10), is AFFIRMED, and a civil penalty of $220.00 is ASSESSED.

4. Item 1 of citation 2, alleging a nonserious violation of 29 CFR 1926.152(a)(1), is AFFIRMED, and no penalty is ASSESSED.

APPEARANCES:

Daniel A. Caldwell, Esquire, Office of the Solicitor, U. S. Department of Labor, Atlanta, Georgia, on behalf of complainant

Mr. Bernard M. Cole, President, Georgia Narrow Fabrics Corp., pro se

## DECISION AND ORDER

Respondent, Georgia Narrow Fabrics Corp., has its principal office in the state of New York. Respondent operates a manufacturing plant in Jesup, Georgia, where it engages employees in the production of fabrics and other materials.

On July 29 and 30, 1981, a compliance officer representing the Secretary of Labor conducted an inspection of respondent's Jesup operation under the provisions of the Occupational Safety and Health Act (29 U.S.C. § 651, et seq.). As a result of this inspection, respondent was charged with one serious violation consisting of eight items and one "other" violation consisting of thirteen items. Respondent filed its notice of contest on August 24, 1981, and a hearing was conducted in Savannah, Georgia, on March 25, 1982.

In its notice of contest, respondent did not dispute the fact of violations but did contest the payment of penalties in the amount of $1,470. At the hearing Mr. Bernard M. Cole, respondent's president, confirmed that the fact of violations was not in dispute (Tr. 9). Thus, the sole issue for determination by the undersigned Administrative Law Judge is whether the proposed penalty, under the circumstances of this case, is appropriate.

Section 17(j) of the Act sets forth the factors to be considered in determining penalties under the Act as follows: (1) size of the business, (2) the gravity of the violations, (3) the good faith of the employer, and (4) history of previous violations.

In computing the proposed penalties, the Secretary gave due regard to all of the above factors in accordance with the Secretary's regulations (Tr. 14). No reduction of penalties was allowed for the size of the business since the company employs in excess of one hundred employees (Tr. 12). A 20 percent reduction was allowed for good faith in this case in lieu of the maximum of 30 percent allowed under the regulations for this factor. The maximum 10 percent was allowed for history, and it does not appear in the record that the respondent has been previously cited for violations of the Act. No reduction of penalty was allowed for the gravity factor.

The Secretary is empowered by law to propose penalties in cases of this type, but it is the Review Commission which is the final arbiter of such penalties. Secretary v. OSAHRC and Interstate Glass Co., 487 F.2d 438 (8th Cir. 1973). The Commission must give due consideration to the purposes of the Act and arrive at a just and equitable penalty in keeping with the circumstances of each case. Primary emphasis must be placed on the gravity of the violations. Nacirema Operating Company, 72 OSAHRC 1/B10, 1 BNA OSHC 1001, 1971-73 CCH OSHD ¶ 15,032 (No. 4).

The gravity factor is determined by the possibility that exposure to the cited hazards may result in serious bodily injury or death to employees. Thus, it is necessary to examine the circumstances alleged in the citations issued. Respondent has been charged with and has admitted a number of serious violations. The most serious include:

1. Exposing employees to work on an elevated platform 8 feet 9 inches above the floor to a falling hazard since there were no standard railings to prevent falling from this height in the rear knit office.

2. Failure to provide drenching or flushing facilities in an area where employees were exposed to corrosive materials.

3. Allowing employees to use circular hand-fed rip saws which were not properly guarded.

4. Failure to insulate steam pipes in the dye house.

It is obvious that these conditions pose some threat of injury to employees. However, it does not appear that any of these conditions would be life-threatening or would even constitute a basis for concluding that employee exposure would result in grave bodily harm. The undersigned has carefully reviewed the work sheets used in computing the proposed penalties in this case (Ex. C-1 through C-8) wherein the compliance officer evaluated such factors as the number of employees exposed, the frequency of exposure and the proximity to danger. Based upon this review, I conclude the gravity factor should be assessed as low to moderate[1/] and the penalties should be accordingly reduced.

---

1/ These sheets consistently reflect a low or moderate rating on each factor assessed.

Two other factors have been considered in determining a proper penalty in this case. The record reflects all violations were immediately abated when called to respondent's attention. It further appears that respondent has an ongoing safety program of its own administered by its insurance carrier (Tr. 5-6) and is sincerely interested in the safety and health of its employees. After due consideration of the entire record, a penalty of $800 is considered appropriate and will be assessed.

## ORDER

Citation Nos. 1 and 2 are affirmed and a penalty of $800 is assessed.

Dated this 18th day of May, 1982.

## NOTICE OF DECISION

Secretary of Labor v. AL COHEN CONSTRUCTION CO.

OSHRC Docket No. 80-2727

1. Enclosed is a copy of my decision. It will be filed with the Commission on May 19, 1982, and will become the final order of the Commission on June 18, 1982, unless a Member of the Commission directs that it be reviewed.

2. You may petition for discretionary review of this decision by the Commission. A petition may be filed directly with me within twenty (20) days from the mailing of my decision. Thereafter, a petition should be mailed to the Executive Secretary, Attention:

   Chief Review Counsel
   Occupational Safety and Health Review Commission
   1825 K Street, N.W., Suite 601
   Washington, D.C. 20006.

   Any petition filed directly with the Commission will be considered to the extent that time and resources permit. The last day the Commission may consider your petition is June 18, 1982. This final order date is fixed by law and cannot be extended under any circumstances.

3. If review is ordered by a Member of the Commission, each party to this case will be notified. In addition, each party will be given an opportunity to submit a brief to the Commission.

4. Please complete the enclosed postcard indicating whether you presently intend to seek review of this decision and mail the completed card promptly. Your response does not bind you in any way, but it assists the Commission in processing your petition when it is filed.

5. For any further details on the review process, see Commission Rules 90, 91, 92, and 93.

Quentin P. McColgin

Quentin P. McColgin
Judge, OSHRC

Date: April 29, 1982

OSHRC FORM 97

UNITED STATES OF AMERICA

OCCUPATIONAL SAFETY AND HEALTH REVIEW COMMISSION

| | |
|---|---|
| SECRETARY OF LABOR<br><br>Complainant,<br><br>v.<br><br>AL COHEN CONSTRUCTION COMPANY,<br><br>Respondent | OSHRC DOCKET NO. 80-2727<br>JUDGE'S DECISION<br>MAY 17 '82<br>RECEIVED<br>FINAL ORDER ON JUN 18 '82 |

ORDER

Complainant, in his motion dated May 11, 1982, entitled "Motion to Amend Decision and Order" requests that the Decision and Order which were served on the parties April 29, 1982, be amended to correct an error which appears on page nine of such decision.

Good cause having been shown and counsel for respondent reporting that he does not object to the relief requested, complainant's motion is hereby granted.

IT IS THEREFORE ORDERED that line nine of page nine of the Decision and Order in this proceeding which bears the issuance date of May 19, 1982, be amended to read:

"instance d) has not been made out."

It is further ordered that the corrected page attached to this order, which is numbered "9 (amended)" be substituted for page nine of such decision.

SO ORDERED.

Quentin P. McColgin
Judge, OSHRC

Dated: May 17, 1982

opening was to step on a piece of plyboard which was used as a partial cover for the floor opening. (C-13) However, as depicted in C-10, C-11 and C-12, there was debris on the middle of this piece of plyboard which would have operated as a barrier between the person who was observed stepping on one end of the partial cover and the exposed floor opening on the other end. Since the compliance officer admitted that the employee was not going in the direction which would have exposed him to danger, (Tr. 163) employee access to the hazardous condition alleged in instance d) has not been made out.

Complainant has further failed to establish the requisite employee exposure to the hazardous conditions created by the absence of toeboards on the fourteenth-floor level. While there is ample evidence of the existence of debris near the floor opening on the fourteenth-floor level, the evidence does not establish the presence of someone below the floor opening during the time there was anyone who was near the platform containing the debris on the fourteenth-floor level. Indeed, the compliance officer who conducted the inspection testified that he did not observe debris being dropped down through the elevator shaft during his inspection. (Tr. 183, 184, 206, 215-16; see also Tr. 282)

While not challenging the serious characterization of this violation, respondent nevertheless argues that the proposed penalty of $640.00 for this violation is excessive. This argument is found to be without merit. The hazardous conditions that existed on the tenth-, eleventh- and twelfth-floor levels in each case exposed at least one of respondent's employees to a fall hazard of approximately 100 feet or greater. While it would appear from this record that the duration of exposure to the hazardous conditions created by the open-sided floors was limited,

DECISION AND ORDER

Quentin P. McColgin, Administrative Law Judge: This is a proceeding under §10(c) of the Occupational Safety and Health Act of 1970 (the Act), 29 U.S.C. §§659(c) involving alleged violations of §§5(a)(1) & 5(a)(2) of the Act, 29 U.S.C. §§654(a)(1) and (a)(2). */ The jurisdictional issues are admitted in the pleadings.

This matter arose out of an inspection of a work site located at 1601 Arapahoe Street, Denver, Colorado, where respondent was engaged in construction. As a result of that inspection, three citations containing an aggregate of eleven items were issued to respondent, all of which were duly contested.

*/ "Each employer--(1) shall furnish to each of his employees employment and a place of employment which are free from recognized hazards that are causing or are likely to cause death or serious physical harm to his employees; (2) shall comply with occupational safety and health standards promulgated under this [Act]."

A hearing was held in this matter on November 19 & 20, 1980. No appearance was entered on behalf of the affected employees. (Tr. 3-4)*/ At the outset of the hearing, respondent moved to withdraw its notice of contest as to Citation No. 3, Item Nos. 4 & 6, which motion was granted.**/ At the conclusion of the hearing, both parties waived closing argument indicating that they would file briefs. (Tr. 355) Thereafter respondent filed proposed findings of fact and proposed conclusions of law, together with a brief in support thereof (Respondent's brief). No posthearing submissions were filed on behalf of complainant.

Having heard and observed the witnesses and having considered the testimony and other evidence together with the pleadings and arguments presented in this matter, the undersigned hereby issues the findings, conclusions and order set forth in this decision. To the extent that the proposed findings of fact and proposed conclusions of law have not been adopted in this decision, they are rejected as being either inaccurate or unnecessary for the disposition of this case. To the extent there are any pending motions that have not been specifically granted herein, such motions are denied.

## DISCUSSION

The nine alleged violations at issue here consist of a single alleged violation of the general duty clause, (§5(a)(1) of the Act, 29 U.S.C. §654(a)(1)) and eight alleged violations of construction

---

*/ The following abbreviations shall be used in this decision:
Tr. - Transcript page number
C - Complainant's Exhibit number
R - Respondent's Exhibit number
RB - Respondent's brief

**/ These items are affirmed in the order issued herein.

standards. To establish a violation of the general duty clause, the Secretary must prove (1) that the employer failed to render its workplace free from a hazard which was (2) recognized, (3) the occurrence of an incident was reasonably foreseeable, and (4) the likely consequence in the event of an incident was death or serious physical harm to its employees. Western Massachusetts Electric Co,., 9 BNA OSHC 1940, 1981 CCH OSHD ¶25,470 (76-1174, 1981); Bomac Drilling, Division of TRG Drilling Corp., 9 BNA OSHC 1681, 1981 CCH OSHD ¶25,363 (No. 76-0450, 1981). The Secretary must also show (5) that there was a feasible means of abating the hazard. National Realty & Construction Co. v. OSHRC, 489 F 2d 1257 (D.C. Cir. 1973). To establish a violation of a standard, the Secretary must show (1) the cited standard applies to the facts, (2) there was a failure to comply with the cited standard, (3) employees had access to the hazardous condition, and (4) the employer knew or could have known of the condition with the exercise of reasonable diligence. Daniel International Corp., Wansley Project, 9 BNA OSHC 2027 1981 CCH OSHD ¶25,813 (No. 76-0181, 1981).

Because of the discrete nature of the alleged violations at issue here, they will be discussed separately.

§5(a)(1) of the Act

The first charge, as set forth in Citation No. 1, Item No. 1, is:

> Section 5(a)(1) of the Occupational Safety and Health Act of 1970: The employer did not furnish employment and a place of employment which were free from recognized hazards that were causing or were likely to cause death or serious physical harm to employees, in that:
>
> > A safe means of access was not provided for employee(s) working on the 4th floor level; employee(s) were required to

climb the end member of the scaffold stairway and step over an opening of 19 inches to floor ledge to gain access to working area, exposing employee(s) to a falling hazard in excess of 25 feet.

The basis for this charge is that the compliance officer who inspected the worksite observed respondent's employees working on the fourth-floor level. Observing no other means of access to this level other that the scaffold that was located in the stairway shaft and observing a 19-inch gap between the side of the scaffold and the adjacent floor ledge where he thought the employees must have gained access (the north side) the compliance officer concluded that the employees who gained access on that side were subjected to the hazard of falling through the 19-inch gap to the first-floor level, which was forty feet below.

Respondent's carpenter foreman, on the other hand, testified that the north side of the scaffold was not intended as the place for gaining access to the fourth-floor level. He testified that he had caused a guardrail to be placed on that side to prevent access there and had intended employees to gain access at a point designated on C-31 "A" which was on the west side of the scaffold, near the north end. He further testified that his intended access point was the most convenient place to gain access to the fourth-floor level, and that he had witnessed employees using such point as a place of access.

Since the compliance officer did not observe anyone accessing the fourth-floor level from the scaffold or vice versa and did not testify as to any statements made to him which conflicted with the aforesaid testimony of the foreman, the latter's testimony stands unrefuted. Thus, it is found that entry to the fourth level was gained at the point

designated on C-31 as "A". Since the gap between the scaffold and the adjacent floor ledge was only six inches on this side, the hazard of falling through the gap to the first level did not exist. For this reason, the alleged general duty violation has not been established.

29 C.F.R. §1926.350(a)(7)

The second charge involves an alleged serious violation of 29 C.F.R. §1926.350(a)(7). The specific charge, as set forth in Citation No. 1, Item No. 2, is:

> 29 CFR 1926.350(a)(7): A suitable cylinder truck, chain, or other steadying device was not used to keep compressed gas cylinder(s) from being knocked over while in use:
>
> > Basement level, south side--oxygen and acetylene cylinders with regulators attached and in use leaning against the south wall on unstable ground.

The standard provides:

> A suitable cylinder truck, chain, or other steadying device shall be used to keep cylinder bottles from being knocked over while in use.

The evidence establishes a violation of the cited standard. It is undisputed that there were two cylinders--an oxygen cylinder and an acetylene cylinder--in the basement of respondent's work place. These cylinders were propped up against a wall without any measures having been taken to prevent them from being knocked over. Hoses were attached to the cylinders and, while the compliance fficer did not know how much pressure there was in each cylinder, there were readings on the pressure gauges and they were in use. (Tr. 147-48) Additionally, there is evidence that five of respondent's employees were in the area, (Tr. 148) one of whom was within two feet of the cylinders. (Tr. 153)

The foregoing establishes that respondent failed to comply with an applicable standard. Furthermore, under this standard, there is a

rebuttable presumption that the cylinders contained at least enough residual gas to present a hazard to the employees in the area. Austin Building Company, 8 BNA OSHC 2150, 1980 CCH OSHD ¶24,839,(No. 77-3878, 1980); Williams Enterprises, Inc., 7 BNA OSHC 1015; 1979 CCH OSHD ¶25,279 (No. 14748, 1979). Since this presumption has not been rebutted, the evidence is sufficient to establish that respondent's employees had access to the hazardous condition. Finally, the volative condition was in plain sight in an area where respondent's employees were working. Thus, respondent's representatives, with the exercise of reasonable diligence, could have detected such conditions, and respondent is charged with constructive knowledge thereof. MCC of Florida, Inc., 9 BNA OSHC 1895, 1981 CCH OSHD ¶25,420 (No. 15757, 1981)

Respondent's defense to this charge is confined to an asserted failure of proof that the cylinders were in use and that respondent had knowledge of the volative conditions. Having found that the cylinders were in use and that respondent had constructive knowledge of the volative conditions, respondent is found to have violated the cited standard.

Respondent also challenges the characterization of the violation as serious, arguing that complainant failed to prove a substantial probability that death or serious physical injury could result from the unsecured cylinders. The sole evidence pertaining to the serious nature of this violation consists of a brief recitation by the compliance officer of having been shown in a training institute how compressed gas cylinders with broken stems have taken off and gone through brick walls. (Tr. 33) However, the compliance officer failed to determine the pressure

of the cylinders involved here. Thus, whether these cylinders had the capability of becoming projectiles is purely a matter of conjecture. (Tr. 146, 155)

For these reasons, it is found that the evidence is insufficient to establish a serious violation of the standard. Accordingly, the violation is affirmed as an other than serious violation and no penalty shall be assessed.

29 C.F.R. §1926.500(b)(1)

The third charge, as set forth in Citation No. 2, Item No. 3, is:

> 29 CFR 1926.500(b)(1): Four opening(s) were not guarded by standard railings and toeboards or covers:
>
> a) 10th floor--standard rail was not provided on the south side of elevator shaft floor opening, exposing the employee working in this area to a falling hazard in excess of 40 feet.
>
> b) 11th floor--employee exposed standing on edge of elevator shaft opening (12'9" x 7') cutting operation, standard guardrail not installed, exposing employee to a falling hazard in excess of 50 feet.
>
> c) 12th floor--elevator shaft opening (12'9" X 7' was not provided with standard guardrails on all open sides. Employee exposed to falling hazard; area is used for access to and from 9 1/2 ft. scaffold work station.
>
> d) 14th floor at stairway landing, north side of elevator shaft opening--seven ft. section was not guarded by standard railings and toeboards at walkway to outside balcony. Toeboards required at elevator shaft opening in addition to the existing standard railing.

The cited standard, 29 C.F.R. &1926.500(b)(1) provides:

> Floor openings hall be guarded by a standard railing and toeboards or covered as specified in paragraph (f) of this section. In general, the railing shall be provided on all exposed sides, except at entrances to stairways.

Respondent's arguments in opposition to this violation are limited to the issue of whether respondent's employees were exposed to the

hazardous condition of unguarded floor openings at the designated floor levels. Insofar as they apply to the conditions on the tenth, eleventh, and twelfth levels (instances a), b), and c)), these arguments are without merit. With respect to instance a)--the floor opening at the tenth floor level--there is unrefuted evidence that the employee was observed "standing at the edge of the opening. . ." (Tr. 35) With respect to instance b)--the eleventh floor level--it is clear from the citation and the testimony of the compliance officer that the person considered by the Secretary as being exposed to the hazard of the unguarded floor opening was the person described as the helper, who is shown in the photographs admitted into evidence to have been close enough to the edge of the floor opening on the eleventh floor to be exposed to a fall hazard. (C-5 & C-6A & B)[*/] Thus, employee exposure, as alleged in instance b), has clearly been established.

Employee access to the hazardous condition created by the unguarded floor opening on the twelfth floor has also been established. The photographs in evidence as C-7A-C and C-8 are sufficient in themselves to establish employee exposure to the hazardous condition described in instance c). These photographs show that in order to gain access to the scaffold on the twelfth-floor level or to exit therefrom, the employee shown on the scaffold would be within a few feet of the unguarded floor opening. This evidence is sufficient in itself to establish the violation as alleged in instance c).

Respondent's argument of a lack of employee exposure to the unguarded floor opening on the fourteenth floor is well-taken. The evidence with respect to employee access to the floor opening on this floor indicates that the closest anyone got to the unguarded floor

---

[*/] There is evidence which indicates that this helper would have been required to have been within the perimeter of the guarded area during certain phases of his work. (Tr. 159) However, there is also evidence which shows that during other phases of his work he would have been outside the perimeter of the guarded area. (Tr. 159)

opening was to step on a piece of plyboard which was used as a partial cover for the floor opening. (C-13) However, as depicted in C-10, C-11 and C-12, there was debris on the middle of this piece of plyboard which would have operated as a barrier between the person who was observed stepping on one end of the partial cover and the exposed floor opening on the other end. Since the compliance officer admitted that the employee was not going in the direction which would have exposed him to danger, (Tr. 163) employee access to the hazardous condition alleged in instance c) has not been made out.

Complainant has further failed to establish the requisite employee exposure to the hazardous conditions created by the absence of toeboards on the fourteenth-floor level. While there is ample evidence of the existence of debris near the floor opening on the fourteenth-floor level, the evidence does not establish the presence of someone below the floor opening during the time there was anyone who was near the platform containing the debris on the fourteenth-floor level. Indeed, the compliance officer who conducted the inspection testified that he did not observe debris being dropped down through the elevator shaft during his inspection. (Tr. 183, 184, 206, 215-16; see also Tr. 282)

While not challenging the serious characterization of this violation, respondent nevertheless argues that the proposed penalty of $640.00 for this violation is excessive. This argument is found to be without merit. The hazardous conditions that existed on the tenth-, eleventh- and twelfth-floor levels in each case exposed at least one of respondent's employees to a fall hazard of approximately 100 feet or greater. While it would appear from this record that the duration of exposure to the hazardous conditions created by the open-sided floors was limited,

respondent's size (a medium-size employer), coupled with its previous history of having violated safety standards--makes the imposition of a $640.00 penalty for this violation appropriate.

29 C.F.R. §1926.28(a)

The fourth charge involves an alleged repeated violation of the personal protective equipment standard. The specific allegation, as set forth in Citation No. 2, Item No. 1, is:

> 29 CFR 1926.28(a): Appropriate personal protective equipment was not worn by employee(s) in all operations where there was exposure to hazardous conditions:
>
> a) 11th floor inside elevator haft (sic) opening employee(s) performing cutting operation, working off of a 4' X 8' 3/4" inch sheet of plywood was not provided with safety belt and life line, exposing employee to a falling hazard in excess of 50 feet.
>
> b) 13th floor east side of elevator shaft opening--(12 feet, 9 inches by seven feet)--Employee making observations for installation of guard rails was not provided with a safety belt and lifeline attached, exposing employee to a falling hazard in excess of 60 feet.

This standard, 29 C.F.R. §1926.28(a), provides:

> The employer is responsible for requiring the wearing of appropriate personal protective equipment in all operations where there is an exposure to hazardous conditions, or where this part indicates the need for using such equipment to reduce the hazards to the employee(s).

With respect to instance a), respondent concedes the relevant facts necessary to establish a prima facie violation of the standard. (RB at 20) Nevertheless, respondent asserts here the affirmative defense of employee misconduct. The proof establishes that respondent maintained a specific work rule requiring the wearing of safety belts in the conditions such as those presented in instance a). (Tr. 309-10) The proof further shows that such rule was effectively communicated and enforced; but that, without its knowledge, respondent's employees violated such rule.

This work rule was discussed on at least one occasion at respondent's weekly safety meetings held during January, 1980.*/ (Tr. 311-12, 335-36) Additionally, the immediate supervisor of the employees who violated the work rule in instance a) personally instructed every new man on the job how and when to tie off. (Tr. 326) Furthermore, the proof establishes that the two employees who were not tied off were given specific instructions by their immediate supervisor on how to tie off at their work station prior to the time they were observed working without being tied off. (Tr. 265-66) Additionally, they were issued safety belts and lanyards that very morning with which to tie off. (Tr. 313, 327)

The only evidence which can be construed as conflicting with the foregoing is the testimony of the compliance officer who testified that when he spoke to the two employees immediately after they were observed working without being tied off, one of them, identified as Randy Crawford, told him that the reason he was not wearing his safety belt was because respondent "ran out of safety belts." (Tr. 79-80) However, little credence is given to this uncorroborated statement. First of all, the employee who allegedly made this statement, Randy Crawford, was not working on the floor where the hazardous condition was observed on the day in question. (Tr. 241-42) The more credible evidence establishes that the two employees involved were Mr. Strenge and Mr. Lapointe. (Tr. 242, 307) Secondly, both had been issued safety belts the morning before the inspection (Tr. 327-28) and both had been observed using them earlier that day. (Tr. 329) Finally, there was testimony that there were approximately twenty safety belts on the job site, and that respondent had not run out of the necessary equipment. (Tr. 241-42, 307, 314) Thus, it appears that if the compliance officer was told by one of the

*/ Attendance at these meetings was mandatory. (Tr. 312)

offending employees that respondent had run out of safety belts, such statement was more likely a self-serving declaration than it was an accurate statement concerning the availability of personal protective equipment at respondent's work place.

It further appears that respondent adequately enforced this work rule. While only one of respondent's employees had been terminated prior to the inspection for safety rules infractions, (Tr. 299) there is evidence that oral reprimands had been given for safety infractions in advance of the inspection. (Tr. 252) The evidence also shows that employees who continued to violate safety rules were terminated. (Tr. 315-16, 338)

Indeed, respondent's enforcement program seems both reasonable and adequate when it is considered that this was a relatively new job with new employees. The first laborers, which were the category of employees who were involved in instance a), came on the job in late January. (Tr. 325) By March 13, two or three safety infractions had been observed and had been dealt with by oral reprimands. (Tr. 252) As a result of the infraction which occurred March 17, one of the offending employees was demoted to an unskilled position with a consequent reduction in pay, whereas the other employee, who was unskilled and untrained, was transferred to a less hazardous job assignment. (Tr. 348) Subsequent thereto, more severe discipline, including termination, was administered for repeated safety violations. (Tr. 316)

Thus, it is found that respondent maintained an adequate safety program which included the existence of specific rules designed to

prevent violations such as the one involved here, an effective method of communicating these rules to its employees, both in writing and orally, and regular supervison to insure that the rules were enforced. Under these circumstances, it is found that the hazardous condition described in instance a) of the citation was the result of employee misconduct and the violation cannot be sustained.

Respondent's defense to the second alleged violation of this standard--instance b)--is twofold. First, respondent argues that there has been a failure of proof that a "reasonable person, familiar with the factual circumstances surrounding the allegedly hazardous condition, including any facts unique to a particular industry, would recognize a hazard warranting the use of such equipment." (RB at 25) Secondly, respondent asserts the affirmative defense of impossibility of compliance to this alleged violation.

The relevant facts, which are uncontroverted, are that one of respondent's employees was observed on the thirteenth-floor level of respondent's workplace, was not wearing a safety belt and lanyard which was tied off while he was engaged in making observations for the installation of guardrails for a floor opening on that level. This employee was observed by the compliance officer who was on the twelfth-floor level who observed the employee walking the 10 to 12 foot length of a ledge next to the floor opening which ledge was from four to five feet wide.

It is not necessary to consider respondent's first argument because the evidence establishes the existence of both elements of the impossibility defense. To establish this defense, respondent must show (1) compliance with the requirements of the standard (a) would be functionally impossible

or (b) would preclude performance of the required work, and (2) alternative means of employee protection were unavailable. M. J. Lee Construction Co., 7 BNA OSHC 1140, 1979 CCH OSHD ¶23,330 (No. 15094, 1979).

The evidence establishes that the only feasible place which could be used by the employee walking the ledge on the thirteenth-floor level to tie off was between the supporting columns located on the opposite side of the floor opening from the ledge.*/ (Tr. 245) Because of this circumstance, it would not be possible to tie off to these columns with a lanyard designed to prevent a fall of less than six feet, and still have the employee perform his necessary function. To the contrary, the evidence establishes that a lanyard in excess of fifteen feet (which would be in clear violation of 29 C.F.R. 1926.104(d)) would be required in order to tie off between the columns. (Compare Tr. 172-74 with Tr.245)

Thus, it is found that it would be impossible to comply with the applicable regulations and still perform the required task of taking measurements for the installation of guardrails around the unguarded floor opening on the thirteenth floor. It is further found that alternative means of protection were unavailable. Here, the only alternative means of protection suggested is the installation of guardrails which could not be installed until the employee involved here completed his task of taking the measurements for such guardrails. Thus, the elements to the impossibility defense having been established as to the hazardous conditions involved in instance b), the alleged violation of the personal protective equipment standard cannot be sustained.

---

*/ There is some suggestion in the record that a tie off could have been made to the column between the windows above the floor ledge (Tr. 83, C-17) or to studs positioned in the wall behind the ledge. (Tr. 173) However, the proof establishes that such alternative tie off places were inadequate. (Tr. 246, 275)

29 C.F.R. §1926.302(b)(1)

The fifth charge, as set forth in Citation No. 3, Item No. 1, is:

> 29 CFR 1926.302(b)(1): Pneumatic power tool(s) were not secured to the hose or whip by some positive means to prevent the tool from becoming accidentally disconnected:
>
> > Basement level, south side - pneumatic hammer hose length was not provided with safety retainer clips at connection point.

This standard, 29 C.F.R. §1926.302(b)(1) provides:

> Pneumatic power tools shall be secured to the hose or whip by some positive means to prevent the tool from becoming accidentally disconnected.

The evidence establishes that this citation was issued because of a lack of a safety retainer clip or other positive means being used to prevent the accidental disconnection of two lengths of hose that were connected to an air hammer. (Tr. 175) However, the cited standard has been construed to apply only to the connection between the power tool and the hose, and not to the connection between two lengths of hose. Dick Corporation, 7 BNA OSHD 1951, 1979 CCH OSHD ¶24,078 (No. 16193, 1979). Thus, the cited standard does not apply to the cited conditions, and the alleged violation cannot be affirmed.

29 C.F.R. §1926.352(e)

The sixth charge, as set forth in Citation No. 3, Item No. 2, is:

> 29 CFR 1926.352(e): Additional fire prevention precautions were not provided when welding, cutting, or heating operations were such that normal fire prevention precautions were not sufficient:
>
> > 11th floor--employee(s) performing cutting operation at elevator shaft were not provided with a fire watch, sparks falling down shaft exposing employee(s) working at lower levels to a potential fire hazard.

This standard, 29 C.F.R. §1926.352(e), provides:

> When the welding, cutting, or heating operation is such that normal fire prevention precautions are not sufficient,

additional personnel shall be assigned to guard against fire while the actual welding, cutting, or heating operation is being performed, and for a sufficient period of time after completion of the work to insure that no possibility of fire exists. Such personnel shall be instructed as to the specific anticipated fire hazards and how the firefighting equipment provided is to be used.

The evidence in support of this charge consists exclusively of the testimony of the compliance officer who conducted the inspection. He observed a cutting operation being performed on the eleventh-floor level (Tr. 105) which resulted in sparks falling on an employee who was working on the tenth-floor level. (Tr. 177)[*/] He further testified that he "couldn't see a fire watch or any type of fire extinguishers." (Tr. 106) Respondent's labor foreman, on the other hand, testified that a fire watch with a fire extinguisher was stationed on the tenth-floor level during the cutting operations on the eleventh floor. (Tr. 320) He further testified that the fire watch also had at his disposal a water hose, which ran up the elevator shaft from the first level to the twelfth level. (Tr. 321) Finally, he testified that the fire watch was trained in the use of both the hose and the extinguisher. (Tr. 321)

The testimony of respondent's foreman stands unrefuted. It is not clear that the compliance officer even looked on the tenth-floor level for the fire watch. (See Tr. 105-107, 176-78) He did not even ask to be shown the fire extinguishers when he was told that they were present; instead, he relied upon the absence of such extinguishers in the photographs he had taken during his inspection as a basis for concluding that the fire extinguishers were not present. (Tr. 106) Finally, the

---

[*/] It is clear from the compliance officer's testimony that he considered only one person affected by the hazardous condition he observed, namely the person located on the tenth-floor level. (Tr. 176-77)

compliance officer didn't even know whether there was a water hose running up the elevator shaft which could have been used as a means of additional fire protection. (Tr. 178) Thus, the testimony of respondent's representative stands unrefuted.

Moreover, the Secretary has failed to identify what "normal fire precautions" were taken by respondent nor has he established why these precautions were "insufficient" so as to require the stationing of a fire watch at respondent's worksite. For these reasons, it is found that the evidence offered in support of the charge is patently insufficient to establish the violation.

29 C.F.R. §1926.450(b)(5)

The seventh charge, as set forth in Citation No. 3, Item No. 3, is:

> 29 CFR 1926.450(b)(5): The side rails of a job-made single cleated ladder was (sic) not parallel or flared top to bottom by not more than one-quarter of an inch for each 2 feet of length:
>
> Basement level south side-- A-frame ladder used by employees to make water hose connections.

This standard, 29 C.F.R. §1926.450(b)(5), provides:

> Side rails shall be parallel or flared top-to-bottom by not more than one-quarter of an inch for each 2 feet of length.

Respondent's challenge to this charge is limited to the applicability of the standard. Respondent's principal argument is that the standard, properly interpreted, does not apply to the cited conditions. Additionally, respondent argues that there is a failure of proof that the ladder at issue here was "job-made."

While conceding that the ladder was not parallel and that it flared more than is permitted by the standard, respondent argues that the standard, properly interpreted, does not apply where the flare is at the bottom of the ladder rather than at the top. While respondent's argument as to the proper construction of the standard is persuasive, the issue need not be decided on that basis.

By its terms, the cited standard applies only to "job-made" ladders. Here, the compliance officer admitted that the ladder at issue here was not job-made. (Tr. 183) Thus, the cited standard is found to be inapplicable to the cited conditions and complainant has failed to establish the violation, as charged.

The eighth charge, as set forth in Citation No. 3, Item No. 5, is:

> 29 CFR 1926.500(b)(8): Floor hole(s) were not guarded by a standard railing and toeboard or a floor hole cover of standard strength and construction secured against accidental displacement:
>
> a) 17th floor - two floor holes measuring 3 inches and 8 inches in diameter at stairway.
>
> b) 18th floor - two floor holes measuring 3 inches and 8 inches in diameter at stairway.

This standard, 29 C.F.R. §1926.500(b)(8), provides:

> Floor hole(s) into which persons can accidentally walk shall be guarded by either a standard railing with standard toeboard on all exposed sides, or a floor hole cover of standard strength and construction that is secured against accidental displacement. While the cover is not in place, the floor hole shall be protected by a standard railing.

The facts pertaining to this charge can be summarily stated. On walkways located on the seventeenth- and eighteenth-floor levels there were two groups of floor holes, each of which consisted of one hole

that was three inches in diameter and one hole that was eight inches in diameter. (Tr. 112-16, C-24, C-25, & C-26) The hazards presented by these condition, as described by the compliance officer, were a tripping hazard and the hazard of debris falling to the lower levels. (Tr. 117) Assuming without deciding that these are the hazards the standard was designed to prevent, and assuming without deciding that the standard is applicable to the cited conditions, the violation, nevertheless, has not been established. Here there is insufficient evidence that respondent's employees were exposed to the conditions perceived as hazardous, for the reason that it is not established that a single employee was working on the seventeenth- or eighteenth-floor levels at the time of the inspection. (Tr. 117)

29 C.F.R. §1926.850(h)

The final charge at issue here, as set forth in Citation No. 3, Item No. 7, is:

> 29 CFR 1926.850(h): Sign(s) warning of the hazard of falling materials were not posted at each level:
>
> > Daniel's & Fisher Tower--1st through 17th floors, at elevator shaft openings.

This standard, 29 C.F.R. §1926.850(h), provides:

> When debris is dropped through the holes in the floor without the use of chutes, the area onto which the material is dropped shall be completely enclosed with barricades not less than 42 inches high and not less than 6 feet back from the projected edge of the opening above. Signs, warning of the hazard of falling materials, shall be posted at each level. Removal shall not be permitted in this lower area until debris handling ceases above.

The facts pertaining to this charge are stated as follows. The compliance officer inspected the worksite, a multi-storied building, on the 13th of March.

That day, he observed that there were no warning signs posted at the unenclosed elevator shaft openings on the various floor levels which would warn employees of the hazard of falling materials. (Tr. 118) He was subsequently informed by the job superintendent that while the elevator shaft was used to dump debris, such dumping operations did not commence until after the end of each work day (3:30 p.m.) when the employees, other than those engaged in the dumping operations, were out of the building. (Tr. 184) The job superintendent also informed the compliance officer of the precautions taken to assure that all employees, other than those engaged in the dumping operations, were out of the building before dumping operations were commenced. (Tr. 184) After confirming these reports by conducting interviews with respondent's employees, (Tr. 184) respondent was nevertheless cited for failing to post warning signs.

When asked to identify the employees who were exposed to the hazardous condition presented by the failure to post such warning signs, the compliance officer identified a single employee, who was observed on the tenth floor level at 10:30 a.m. on March 17. (Tr. 184-85) . The compliance officer admits that no dumping operations were being coonducted at the time this employee was observed on the tenth floor. (Tr. 184) Furthermore, the compliance officer admits that by this day--the 17th of March--signs had been posted warning employees of the danger of falling materials. (Tr. 118)

In view of the foregoing, the most charitable conclusion that can be reached is that the Secretary has failed to prove the requisite employeee exposure to the hazard perceived by the standard. Thus, the violation has not been established.

## FINDINGS OF FACT

1. Respondent constructed and maintained a tubular welded scaffold at its workplace located at 1601 Arapahoe Street, Denver, Colorado, which was used as a means of access to and from the first- through the sixth-floor levels of said workplace. (Tr. 15-16, 233-34)

2. The scaffold was situated in the existing stairway shaft and was adjacent to the floor ledge of the fourth-floor level on three sides. (Tr. 15-16, 233-34)

3. At the fourth-floor level, there was approximately a 19-inch gap between the north side of the scaffold and the adjacent floor level. (Tr. 256-58)

4. At the fourth-floor level, there was approximately a 6-inch gap between the west side of the scaffold and the adjacent floor level. (Tr. 236-38, C-31)

5. Due to the configuration of the stairway shaft, the scaffold could not be moved closer to the floor ledges on the fourth floor, which were adjacent to the north and west sides of the scaffold (Tr. 234)

6. Respondent secured a waist-high guardrail on the north side of the scaffold on the fourth-floor level in order to prevent its employees from using that side as a means of access. (Tr. 239-240, 256)

7. Respondent intended that its employees gain access to and from the scaffold at the fourth-floor level at a point designated on C-31 as "A" which point was on the west side of the scaffold where the gap between the scaffold and the adjacent floor ledge was only 6 inches. (Tr. 236-38, C-31)

8. The area designated as "A" on C-31 was the most convenient place to gain access to and from the scaffold on the fourth-floor level.

9. Respondent's employees gained access to and from the scaffold on the fourth-floor level at the point designated on C-31 as "A". (Tr. 238-39)

10. During the inspection, one or more compressed gas cylinders that were in use were observed propped up against the wall of the basement of respondent's workplace. (Tr. 28-30, C-3) The cylinders were not secured by a cart or other suitable cylinder truck nor were they secured by a chain nor other stabilizing device which would have prevented them from falling over or being knocked over.

11. At least three of respondent's employees were exposed to the hazardous conditions described in the preceding finding. (Tr. 32)

12. The elevator shaft on the tenth, eleventh, twelfth, and fourteenth levels of respondent's workplace were not guarded by standard guardrails on one or more sides or otherwise covered to prevent someone from falling to the ground below.

13. If someone were to have fallen in the floor openings that were unguarded on the tenth, eleventh, twelfth or fourteenth floor levels, a fall of 100 feet or greater would result. (Tr. 36)

14. The tenth, eleventh, twelfth and fourteenth floor levels were not barricaded or posted as restricted areas. (Tr. 78)

15. One of respondent's employees had access to the hazardous condition of the unguarded floor opening on the tenth-floor level in that he was observed at the edge of such opening.

16. At least one of respondent's employees had access to the hazardous condition of the unguarded floor opening on the eleventh-floor level. (Tr. 38-44, C-5 & C-6A & B)

17. The work that was being performed in the floor opening of the eleventh floor level--that of cutting the I-beam in the elevator shaft--could have been performed with standard guardrails installed to guard the perimeter of the floor opening. (Tr. 41, 44, C-5 & C-6A & B)

18. At least one of respondent's employees had access to the hazardous condition of the unguarded floor opening on the twelfth-floor level in that such employee was within a few feet of the opening when exiting or accessing the scaffold that was located on that level. (Tr. 46-48, C-7A-C, C-8, & C-9)

19. The employee who was observed on the fourteenth-floor level was not walking in the direction which would have exposed him to the hazard of the unguarded floor opening on that level. (Tr. 68-78, C-10, C-11, C-12, C-13)

20. The unguarded floor opening on the fourteenth-floor level was partially covered by a four foot by eight foot piece of plywood which had debris on it. (Tr. 162-63, C-9, C-10 & C-12)

21. Two of respondent's employees, Joe Lapointe and Mark Strenge, were engaged in a cutting operation in the elevator shaft of the eleventh-floor level of respondent's workplace on March 17, 1980. Such employees were not equipped with safety belts and lanyards. (Tr. 38-40, C-5, C-6)

22. Respondent had a well-defined and specific rule requiring the use of safety belts and lanyards by employees assigned cutting operations or other work in the elevator shaft. (Tr. 264-65, 307-08, R-1)

23. Respondent's rule requiring the use of safety belts and lanyards was communicated to its employees through the existence of a written safety manual, discussion of the rule in weekly safety meetings, (Tr. 311-12, 335-36) and specific instructions by the two employees' supervisors, Charles Sheridan and Samuel Graves, to wear safety belts and lanyards, tied to a rope stretched between two nearby columns, while performing cutting operations in the elevator shaft. (Tr. 265-66, 313, 326)

24. The two employees in question were told by respondent to wear their safety belts on March 17, 1980. (Tr. 313)

25. Respondent provided the necessary safety belts and lanyards on the job site, (Tr. 242, 262, 314) and issued such equipment to the two employees in question on March 17, 1980. (Tr. 313, 327)

26. Respondent did not have knowledge that the two employees were working on the eleventh level on March 17, 1980 without their safety belts and lanyards. (Tr. 243, 314)

27. Upon learning of the violation of its safety rules by the two employees, respondent's carpenter foreman ordered the two employees to obtain and wear their safety belts, which they did. (Tr. 169, 242)

28. In response to the violation of its safety rules, respondent's labor foremen disciplined the two employees by threatening them with a layoff or termination, transferring them to different jobs, resulting in the loss of pay to one of the employees. (Tr. 315-16, 348) Approximately three weeks later the other employee was terminated for repeated violations of respondent's safety rules, including the failure to wear safety belt and lanyard. (Tr. 315-16, 349)

29. As part of respondent's safety program, respondent regularly disciplined other employees for violations of its safety rules (Tr. 251, 298-99)

30. One of respondent's employees was observed walking along a four to five feet wide ledge on the thirteenth level of respondent's workplace for the purpose of taking measurements for the installation of guardrails. The employee was not equipped with a safety belt and lanyard. (Tr. 87, 171, C-17)

31. The only appropriate tie-off point for an employee walking the ledge previously described, were the supporting columns located on the opposite side of the opening from where the employee was required to work. (Tr. 245, C-19) Tying off to such supporting columns could not be accomplished with a lanyard which would prevent a fall of not greater than six feet. (Tr. 245, C-19)

32. It was impossible for the employee to tie-off to the column between the windows above the floor ledge where the employee walked because the windows were sealed shut, (Tr. 245-46) and because a tie-off at this point with a lanyard designed to prevent a fall in excess of six feet, would not allow the employee to walk the distance of the ledge, approximately twelve feet. (Tr. 173-74)

33. It was impossible for the employee to tie-off to studs or bolts in the wall behind the ledge where the employee walked because the wall was composed of brittle "gyp block" and would not support a tie-off. (Tr. 246-47, 275) Similarly, a tie-off to studs or bolts in the wall behind the ledge, with a lanyard designed to prevent a fall in excess of six feet, would not allow the employee to walk the distance of the ledge, approximately twelve feet. (Tr. 174)

34. Respondent did not contest a prior citation alleging a violation of §1926.28(a). (Tr. 95-96, C-30)

35. Respondent was cited for failure to provide safety retainer clips at the connection between two lengths of pneumatic hammer hose. (Tr. 175, C-21)

36. Respondent positioned a fire watch with a fire extinguisher and fire hose at the level below the cutting operations at the eleventh floor of respondent's workplace on March 17, 1980. (Tr. 319-29)

37. Respondent's fire watch was fully trained and instructed in the use of the fire extinguisher and the fire hose. (Tr. 321)

38. Respondent maintained a ladder which was wider, by more than 1/4" for each 2 feet of length, at the bottom than at the top. (Tr. 110, C-21)

39. A ladder which is wider at the bottom than at the top is more stable and safer than a ladder whose side rails are parallel or a ladder which is wider at the top than at the bottom. (Tr. 178-83)

40. The ladder at issue was not "job-made". (Tr. 183)

41. A group of holes, one of which was three inches in diameter and the other eight inches in diameter, was observed on both the seventeenth- and eighteenth-floor levels of respondent's workplace. (Tr. 112, C-24, C-25, C-26)

42. Respondent utilized floor openings without a chute for the purpose of dumping debris generated through demolition of the building. (Tr. 117-18)

43. All dumping of debris was conducted after 3:30 p.m., after all employees were out of the building. Respondent utilized radio control to assure that no employees were in the intermediate levels of its workplace during such dumping operations. (Tr. 184, C-33).

44. Warning signs had been posted before the employee was observed in the area wherein he would have been exposed to the danger of falling debris. (Tr. 118, 184)

## CONCLUSIONS OF LAW

1. The evidence is insufficient to establish a violation of §5(a)(1) of the Act, 29 U.S.C. §654(a)(1) in that the proof does not establish that respondent's employees were subjected to a falling hazard while accessing to and from the scaffold on the fourth-floor level of respondent's workplace.

2. Respondent failed to comply with 29 C.F.R. §1926.350(a)(7) in that it failed to provide a suitable cylinder truck, chain, or other steadying device for the one or more compressed gas cylinders which were located in the basement area of respondent's workplace.

3. Respondent's employees had access to the hazardous conditions described in the preceding conclusion and respondent with the exercise of reasonable diligence could have discovered the hazardous condtion. Therefore, respondent violated 29 C.F.R. §1926.350(a)(7).

4. The aforesaid violation was non-serious in nature.

5. In view of the circumstances, it would be inappropriate to assess a penalty for the aforesaid violation.

6. Respondent failed to comply with 29 C.F.R. §1926.500(b)(1) in that it did not provide standard guardrails or covers for floor openings on the tenth-, eleventh-, twelfth- and fourteenth-floor levels of respondent's workplace.

7. Respondent failed to comply with 29 C.F.R. §1926.500(b)(1) in that it failed to provide standard toeboards around the floor openings on the fourteenth-floor level.

8. Respondent either knew or with the exercise of reasonable diligence could have known of the aforesaid hazardous conditions.

9. One or more of respondent's employees were exposed to the hazardous conditions created by the unguarded floor openings on the tenth-, eleventh-, and twelfth-floor levels. Therefore, respondent violated 29 C.F.R. §1926.500(b)(1).

10. The evidence fails to establish the respondent's employees were exposed to the hazardous conditions created by the absence of standard guardrails and toeboards around the floor opening located on the fourteenth-floor level of respondent's workplace.

11. If an accident were to occur as a result of the aforesaid violations of 29 C.F.R. §1926.500(b)(1), death or serious physical injury would likely result. Therefore, such violations were serious within the intent and meaning of the Act.

12. Taking into consideration respondent's size, previous history and good faith together with the gravity of the aforesaid violation, a penalty of $640.00 is appropriate.

13. The evidence establishes that the two employees who were observed near an unguarded floor opening on the eleventh-floor level without appropriate personal protective equipment (safety belts and lanyards) violated respondent's well defined and specific work rule requiring the use of such equipment in such circumstances. The evidence further establishes that such work rule was effectively communicated and enforced and that respondent did not have active knowledge of its employees' noncompliance with such rule. Therefore the defense of employee misconduct has been established to the alleged violation of 29 C.F.R. §1926.28(a) as alleged in instance a) of Citation No. 2, Item No. 1.

14. The evidence establishes that compliance with the personal protective equipment standard--29 C.F.R. §1926.28(a)--was impossible in the case of the employee who was observed near an unguarded floor opening on the thirteenth-floor level. The evidence further establishes that alternative means of protecting such employee were unavailable. Therefore, respondent has established the impossibility defense to the alleged violation of 29 C.F.R. §1926.28(a) as alleged in instance b) of Citation No. 2, Item No. 1.

15. A violation of 29 C.F.R. §1926.302(b)(1) has not been established because such standard does not apply to the cited conditions of failing to provide safety retainer clips at the connection of two lengths of hose attached to a pneumatic hammer.

16. The evidence is insufficient to establish that respondent failed to comply with 29 C.F.R. §1926.352(e).

17. A violation of 29 C.F.R. §1926.450(b)(5) has not been established in that it has not been proven that the ladder was job-made.

18. The evidence is insufficient to establish a violation of 29 C.F.R. &1926.500(b)(8) in that the proof does not establish that any of respondent's employees had access to the seventeenth- and eighteenth-floor levels where unguarded and uncovered floor holes were observed.

19. The evidence is insufficient to establish a violation of 29 C.F.R. §1926.850(h) in that the proof does not establish that any of respondent's employees were exposed to a hazard resulting from respondent's failure to comply with such standard.

## ORDER

In view of the foregoing, IT IS HEREBY ORDERED that:

1. Citation No. 1, Item No. 1, is VACATED.

2. Citation No. 1, Item No. 2, is AFFIRMED as a non-serious violation and no penalty is assessed.

3. Citation No. 1, Item No. 3, is AFFIRMED, and a penalty of $640.00 is ASSESSED.

4. Citation No. 2, Item No. 1, is VACATED.

5. Citation No. 3, Item No. 1, is VACATED.

6. Citation No. 3, Item No. 2, is VACATED.

7. Citation No. 3, Item No. 3, is VACATED.

8. Citation No. 3, Item No. 4, is AFFIRMED, and a penalty of $130.00 is ASSESSED.

9. Citation No. 3, Item No. 5, is VACATED.

10. Citation No. 3, Item No. 6, is AFFIRMED, and no penalty is assessed.

11. Citation No. 3, Item No. 7, is VACATED.

UNITED STATES OF AMERICA

OCCUPATIONAL SAFETY AND HEALTH REVIEW COMMISSION
Room 7B11, Federal Building
1100 Commerce Street
Dallas, Texas 75242

NOTICE OF DECISION

Secretary of Labor v. Metal Recycling Company
OSHRC Docket No. 80-5983

1. Enclosed is a copy of my decision. It will be filed with the Commission on May 19, 1982, and will become the final order of the Commission on June 18, 1982, unless a Member of the Commission directs that it be reviewed.

2. You may petition for discretionary review of this decision by the Commission. A petition may be filed directly with me within twenty (20) days from the mailing of my decision. Thereafter, a petition should be mailed to the Executive Secretary, Attention:

   Chief Review Counsel
   Occupational Safety and Health Review Commission
   1825 K Street, N.W., Suite 601
   Washington, D.C. 20006.

   Any petition filed directly with the Commission will be considered to the extent that time and resources permit. The last day the Commission may consider your petition is June 18, 1982. This final order date is fixed by law and cannot be extended under any circumstances.

3. If review is ordered by a Member of the Commission, each party to this case will be notified. In addition, each party will be given an opportunity to submit a brief to the Commission.

4. Please complete the enclosed postcard indicating whether you presently intend to seek review of this decision and mail the completed card promptly. Your response does not bind you in any way, but it assists the Commission in processing your petition when it is filed.

5. For any further details on the review process, see Commission Rules 90, 91, 92, and 93.

Stanley M. Schwartz
Administrative Law Judge

JUDGE'S DECISION MAY 19 '82 RECEIVED

FINAL ORDER ON JUN 18 '82

Appearances:

Patricia D. Keane, Esq.
Dallas, Texas

For the Complainant.

Thomas L. Varkonyi
El Paso, Texas

For the Respondent.

DECISION AND ORDER

Schwartz, Judge:

This is a proceeding brought before the Occupational Safety and Health Review Commission ("The Commission") pursuant to Section 10 of the Occupational Safety and Health Act of 1970 29 U.S.C. §651 et seq ("the Act"). Respondent contests alleged serious violations of 29 C.F.R. 1910.1025(d)(2); 1910.1025(d)(6(ii); 1910.1025(h)(1); 1910.1025(j)(1)(i); 1910.1025(j)(2)(i) and 1910.1025(l)(1)(ii).

An inspection was commenced at Respondent's workplace on April 9, 1980. Respondent timely contested the subject citation. A hearing was held on the matter on April 27, 1981, and May 21, 1981, in El Paso, Texas. No additional parties intervened in the matter.

Respondent concedes that it is engaged in a business affecting commerce within the meaning of the Act and that the Commission has jurisdiction of the parties and of the subject matter. The issues remaining to be decided are twofold. First whether Respondent violated the aforementioned regulations and if so the appropriate penalties therefor.

The regulations involved in this matter provide as follows:

29 C.F.R. 1910.1025(d)(2): Each employer who has a workplace or work operation covered by this standard shall determine if any employee may be exposed to lead at or above the action level.

29 C.F.R. 1910.1025(d)(6)(ii): If the initial determination or subsequent monitoring reveals employee exposure to be at or above the action level but below the permissible exposure limit the employer shall repeat monitoring in accordance with this paragraph at least every 6 months. The employer shall continue monitoring at the required frequency until at least two consecutive measurements, taken at least 7 days apart, are below the action level at which time the employer may discontinue monitoring for that employee except as otherwise provided in paragraph (d)(7) of this section.

29 C.F.R. 1910.1025(h)(1): Surfaces. All surfaces shall be maintained as free as practicable of accumulations of lead.

29 C.F.R. 1910.1025(j)(1)(i): Medical Surveillance - General. The employer shall institute a medical surveillance program for all employees who are or may be exposed above the action level for more than 30 days per year.

29 C.F.R. 1910.1025(j)(2)(i): Blood lead and ZPP level sampling and analysis. The employer shall make available biological monitoring in the form of blood sampling and analysis for lead and zinc protoporphyrin levels to each employee covered under paragraph (j)(1)(i) of this section on the following schedule:

(A) At least every 6 months to each employee covered under paragraph (j)(1)(i) of this section;

(B) At least every two months for each employee whose last blood sampling and analysis indicated a blood lead level at or above 40 ug/100 g of whole blood. This frequency shall continue until two consecutive blood samples and analyses indicate a blood lead level below 40 ug/100 g of whole blood; and

(C) At least monthly during the removal period of each employee removed from exposure to lead due to an elevated blood lead level.

29 C.F.R. 1910.1025(l)(l)(ii): The employer shall institute a training program for and assure the participation of all employees who are subject to exposure to lead at or above the action level or for whom the possibility of skin or eye irritation exists.

## Evidence

The Secretary presented Ms. Karen Heckmann as its chief witness. Ms. Heckmann is employed as an Industrial Hygienist for OSHA. She previously held the position of Director of Industrial Hygiene for Sherwin-Williams Company in Cleveland, Ohio. She has also taught environmental health (T. 81).

Ms. Heckmann testified that she inspected Respondent's workplace as a result of an employee complaint. The inspection occurred on April 9, 1980. She gave the owner, Mr. Thomas L. Varkonyi a copy of the complaint, held an opening conference and commenced the inspection. The first part of the inspection was visual. She also collected some preliminary wipe samples and bulk samples for materials in the workplace. A bulk sample is a quantity of materials large enough so that a chemist can make a general analysis for content (T. 83-86). Ms. Heckmann explained the results of the bulk samples that she took on April 9, 1980, at the Respondent's workplace. She took one sample near Respondent's small furnace by scooping up a small amount of material into a small glass vial. The vial was capped, labeled and sent by certified mail to a laboratory in Salt Lake City. The parties stipulated that the results of the analyses as indicated on the analyses sheets are correct. This stipulation went to the fact that the tests were properly performed in Salt Lake City and that the chain of custody was intact. The sample

from the furnace area indicated a 19% lead content (T. 87-88; 189; Complainant's exh. 1). A second bulk sample was taken of floor dust which was located near a drill press. This press was in the same general area of the small furnace. The laboratory analysis indicated a 32% lead content (T. 89; Complainant's exh 2).

Ms. Heckmann further testified that she took several wipe samples on April 9, 1980. She explained that a wipe sample is taken with a piece of filter paper. The paper is moistened with distilled water. She tries to take a wipe sample 4" on each side in a square. The filter is put into a glass vial, capped, sealed and sent to Salt Lake City, Utah, for analysis (T. 90-93).

She indicated that one wipe sample was taken from the underside of a cover which was placed over the top of the small furnace noticed at the workplace. This sample showed 23,000 micrograms of lead. A second wipe sample was taken from a steel or metal table top inside a lunchroom. This sample showed 130 micrograms. A third wipe sample taken from the east side of a relay box for the 20 horse power grinder showed 3,000 micrograms of lead. She took a fourth sample off the surface of an air compressor tank. It showed 26,000 micrograms of lead. A final sample was taken from what she described as a dry pulverizing mill cover. It showed 26,000 micrograms of lead (T. 90-96; Exhibits 3-7).

Ms. Heckmann returned to the Respondent's workplace on June 25, 1980, to take air samples. She used a filter which is attached to a pump. The pump draws air through the filter and removes particulate matter from the air which passes through the pump. The filter is approximately 1 1/2" in diameter. The opening which allows air to enter in and around the filter is less than a 1/4" in diameter (T. 123-124).

She described the sampling procedure employed by OSHA. An employee wears an air pump on his belt and a piece of tubing connects the air pump to the filter. She attached the air pump to three employees at Respondent's workplace. Two employees were warehouse employees and one was a warehouseman and welder. The equipment was calibrated on the day prior to the inspection of June 25, 1980. The machines were recalibrated after use on June 25, 1980. The same 2 liters were shown at each calibration (T. 125-129; 132).

The employees wore the pumps for 6 1/2 - 7 hours on June 25, 1980. She took the pumps off for a lunch break. After lunch she replaced the pumps and added new filter devices. She did this by disconnecting the old filter but not removing it from the plastic cassette. It was her practice to place a small plastic cap in the air hole of a used filter and then she placed a snug seal around it. Ms. Heckmann testified that she changed the filters on June 25, 1980, when the type of work changed. Changing the filter helps to identify the source of exposure if you change it simultaneous with work changes (T. 129-130).

One employee, a Mr. Hernandez, had three different filters attached to him during the day. The first one was on for 84 minutes and the second one for 126 minutes. She took the last filter off of Mr. Hernandez at 5:22 p.m. The average for the three filters together showed that Mr. Hernandez had an exposure of .041 milligrams per cubic meter averaged out over eight hours. This result was above the action level of .030 set forth in the regulations (T. 131-132; Complainant's exh. 8).

Ms. Heckmann put the first filter on Mr. Carrillo at 8:55 a.m. and removed the last one at 5:21 p.m. She used three filters. She indicated that the pumps were turned off when she removed them from an individual. There is no likelihood of

contamination getting into the pump and filter once it is turned off. The three filters taken off of Mr. Carrillo were analyzed. They showed an exposure average over 8 hours of .040 milligrams per cubic meter of lead (T. 132-135; Complainant's exhibit 9).

The final employee sampled was a Mr. Pinedo. She used two filters sampling him. He was performing welding during the day and did not have a distinct break in his work as the other two did. His results showed an exposure averaged over eight hours of .036 milligrams per cubic meter. He worked about 7 hours. The average over the eight hour day spreads the same amount of material over a greater period of time and results in lower concentrations (T. 136).

Ms. Heckmann testified that on June 25, 1980, none of the employees sampled had been there for more than 2 months according to their own statements. The employees told her that what they were doing on the day of the air sampling was normal. They were outside for part of the day and inside for part of the day (T. 172; 237). Ms. Heckmann also testified that she had no reason to doubt that what the employees did on June 25, 1980, was what they normally did at Respondent's workplace (T. 237).

The Secretary also called Mr. Richard Dean Wingo, Regional Industrial Hygienist with OSHA. He oversees the industrial hygiene enforcement policy procedures. He has previously worked as a Field Industrial Hygienist in the OSHA Area Office in Oklahoma City. Mr. Wingo testified that he has collected over 2,000 air samples with OSHA and has participated in over 200 industrial hygiene inspections. Forty-five of these inspections have involved lead.

Mr. Wingo stated there are two routes of entry of lead into the body. One is by breathing where lead is inhaled and swallowed into the stomach or digestive tract. The other is ingestion of blood into the body. He also testified that four

areas of the body are affected by lead which is an accumulative toxin. It tends to accumulate and is stored in the bones. Lead affects the central nervous system, peripheral nervous system, blood system itself and the kidneys. It was his opinion that death or serious physical injury could occur (T. 286-290).

Mr. Wingo also explained that an action level is the level in the air where more action must be taken. It is not a level where OSHA requires controls to be installed or that respirators be provided. The action recommended is basically a housekeeping program and a medical program to evaluate the blood. In addition monitoring is required (T. 296).

He also testified that all of Ms. Heckmann's results appear to be extremely reliable. They are consistent and are all about the same level of exposure. This indicates the samples weren't contaminated by external means (T. 323).

The Secretary also called Mr. Hector Pinedo who was a student at El Paso Community College at the time of the hearing. He previously worked for the Respondent for about 2 1/2 - 3 months as a welder and warehouseman. He was one of the employees involved in the air sampling at Respondent's workplace on June 25, 1980. He wore an air pump on that day (T. 22-23).

He indicated that his duties were just about the same on the day air sampling was conducted as on previous days. He spent more time indoors on the day of sampling. He then stated that he also spent his average time welding on that day. Mr. Pinedo stated that on the day of inspection the conditions in the plant were no different than ordinary. They weren't any worse than usual or any better.

On cross-examination Mr. Pinedo indicated that his main duties at Respondent's warehouse involved welding. On the day proceeding the sampling inspection he worked mainly on outside work welding and fixing fence gates. His

usual duties required him to work on the outside. However on the day of the sampling inspection he spent most of the day inside. He also testified that his usual duties included sweeping and picking up big pieces of metal. On the night of June 24 and the day of inspection June 25, 1980, he just picked up big pieces of metal involving his own work. On redirect examination he indicated that he always limited his pick up to his own area. The rest of the place looked like it always looked (T. 24-30).

The Respondent called Mr. Carlos Gonzales as a witness. Mr. Gonzales was assigned to inspect Respondent's workplace as a result of an employee complaint. His inspection dealt primarily with the safety items of the complaint. There was only one safety item out of 6 on the employee complaint (T. 100, 111; Respondent's exh 3).

Mr. Gonzales testified that he explained to Mr. Varkonyi, Respondent's owner, that it was a safety and health complaint. There was no Resident Industrial Hygienist at El Paso so he came to make the safety part of the inspection. He told Mr. Varkonyi there would almost certainly be an industrial hygiene inspection. This hygiene inspection would be a continuation of his inspection. He went to great lengths to explain this procedure because Mr. Varkonyi was quite concerned about being harassed by the INS and other sections of the Department of Labor. He wanted him to understand that the two visits actually constituted one inspection. He stated that it was standard procedure for a industrial hygienist to follow up in his area as soon as one was available (T. 100, 104, 113).

Mr. Stanley Frazier also appeared and testified on behalf of the Respondent. He was employed by the Respondent as a truck driver at the time of the hearing. He was not employed by Metal Recycling Company at the time of the inspection.

He joined the company approximately four months prior to the hearing on April 27, 1981 (T. 200).

Mr. Frazier testified that he has never observed the melting of lead at Respondent's workplace. He has never cut or drilled lead. He has handled lead to put it in a drum and seal it. Mr. Varkonyi has talked to him about the possibility of lead contamination and the need to take a blood test. Mr. Frazier signed an employee blood test waiver (T. 200-202; Respondent's exhibit 5).

Mr. Thomas L. Varkonyi appeared and testified. He is the owner of Metal Recycling Company. He owned the company for almost six years at the time of the hearing. He employs three to four warehouseman and two office employees. These employees generally spend two to three months in his employment. The company recycles metals, plastics and papers. The process involves the collection, packaging and shipping of lead. He handles lead and receives just about any item made of metal (T. 8-10), 12).

The lead is put into 55 gallon steel drums and shipped to smelters. He cuts the lead when it does not fit into the drums. He testified that he cuts lead two or three times a year. The metal is shipped to the smelter when he has a full truckload of approximately 40,000 pounds. Mr. Varkonyi keeps a small melting furnace on the premises. He has used it in the past to melt out small samples before he ships to the smelter. The smelter pays him based on lead content. Therefore he takes a little sample and sends it out to a laboratory to make sure he is not cheated. He stated that he does the melting after working hours when no employees are on the premises. He performs the melting operation once a year because he usually sends out a shipment once a year. The melting pot is 18" high. He also uses a drill press to drill and take samples. He also collects batteries and

ships them once a year. He stores them in a special area on wooden pallets (T. 8-12; 108; 150; 176).

Mr. Varkonyi has never conducted any kind of monitoring for exposure to lead. He has never done any air sampling (T. 12-13). He was aware at the time of the inspection and prior thereto that he had lead on his premises and that he worked with it (T. 16).

Mr. Varkonyi also described his housekeeping program. It includes sweeping the aisles and picking up everything on the floor and putting it into drums. His normal procedure is to sweep the warehouse with wide brooms. They sweep where the dust is accessible or where it seems to fly up. He uses a hose with a head which sprinkles out a very fine mist of water. It is used to wet down the concrete to prevent dust from flying all over. They sweep the area after using the hose. Respondent also has an industrial type vacuum cleaner that suctions up both and wet and dry. This vacuum is used occasionally especially in the sampled area (T. 13, 344).

He also stated that he questioned the reliability of the air sampling results recorded by Ms. Heckmann. He gave as one example the fact that all the men wear gloves with which they have handled lead. He observed the employees reach up and touch the pump during the inspection. He believes the lead from the gloves could have contaminated the samples. He also recalled that the air sampling devices were laid on a table while Ms. Heckmann did her recording. This table was the one where most of the tools and the gloves were laid at lunchtime and after working hours. Mr. Varkonyi did not know if she had the air pump operating when it was laid on the table. He testified that he was not familiar with the use of air sampling devices at the time of the inspection but had read up on the subject subsequently (T. 19-21).

Mr. Varkonyi also testified that he was aware that OSHA was coming back for the air sampling portion of the inspection. He deliberately left the area untouched from the last time it had been used rather than clean it up. He did this in order to allow OSHA to take samples which he thought they wanted. He was afraid if he cleaned it up OSHA would say he was covering up and would use it against him. Therefore he did not sweep up or pick up big pieces of scrap metal. In addition he indicated his employees did not work the same type of job on that day as they usually performed. He knew OSHA was coming for the sampling inspection and felt they would have to be on the premises. He cancelled all pickups for that day and all outside jobs and kept all employees on the premises for the OSHA inspection (T. 15-16; 18).

Mr. Varkonyi also stated that on the day of the air sampling his emplyees were moving some boxes of plastic which contained a very heavy layer of dust, much of which was powered lead. The boxes had been in the warehouse for better than two years and at one period of time were in direct contact with the lead materials. The lead powder was emptied into drums immediately within inches of these same boxes and settled on these boxes.

He indicated that the boxes were moved after a period of time into another room of the warehouse. They were covered up to prevent displacement of the dust. The boxes were moved, loaded and left the warehouse on the day of the air sampling inspection. This movement dispersed the lead powder (T. 391-392).

Mr. Varkonyi also stated that his employees know that they handle lead and that it is toxic. He believes anyone working in the scrap business knows these facts and he also tells them at the time they are hired (T. 351).

## Opinion

### Harassment

Respondent raised the issue of government harassment at the hearing. Stated another way, Mr. Varkonyi argues the inspection was not conducted in a reasonable manner as set forth in the Act. This contention is rejected. The record clearly shows that both Mr. Gonzales and Ms. Heckmann conducted themselves in a courteous and professional manner. Mr. Gonzales went to great lengths to explain why there would be a follow-up inspection by the next available hygienist. The Secretary conducted the initial inspection as a result of a complaint as is required in such a situation. There is no basis in law or fact to conclude that OSHA's actions in this matter in any way constituted harassment of the Respondent, Metal Recycling Corporation.

### Revised Lead Standard

Respondent contends that the revised lead standard requires that this case be decided in his favor. The standard was under reconsideration by OSHA at the time of the hearing. Subsequent to the hearing OSHA issued a document titled "Revised Statement of Reasons on the Feasibility of the Workplace Standard on Lead" (46 FR 60758, December 11, 1981).

I have reviewed the revised lead standard. It has a specific section addressed to the Respondent's industry which is the collection of lead scrap. It details specific reasonable changes which are geared to help small scrap collectors. The revised standard provides for a 30-day exemption from the requirement that engineering controls be installed, use of respirators in some instances and an extended time period for compliance. Overall the lead standard was found feasible for Respondent's industry with the aforementioned changes. These changes do not

affect the action level contained in the original standard, the need for initial and periodic monitoring, medical surveillance, housekeeping or training programs. Consequently these items will be discussed on their merits in this decision.

## Reliability of Air Sampling Measurements

Respondent contends the citations should be vacated on the ground that the samples were contaminated and are unreliable. It suggests this occurred by employees touching the device with their gloves and the placement of the device on a table used for gloves and tools at the end of the day. These contentions must be rejected for two reasons.

First Ms. Heckmann and Mr. Wingo are extremely knowledgeable industrial hygienists. They have extensive qualifications in conducting industrial hygiene inspections including the taking of numerous samples. They gave detailed explanations why the results were consistent and reliable. Mr. Varkonyi's experience in this area is extremely limited. I credit the opinions of Ms. Heckmann and Mr. Wingo on this technical subject giving proper deference to their educational experience as well as hands on experience in the area of air sampling.

In addition the Secretary has established the presence of airborne lead at Respondent's facility. The burden shifted to the Respondent to show, by other than mere suggestion, that these measurements were unreliable. Respondent failed to rebut these measurements. It also did not conduct any tests of its own. Consequently the objections set forth above must be labeled speculative in this case. I find that the figures stated above accurately reflect the amount of airborne lead to which Respondent's employees were exposed.

## Merits

### Items 1A & 1B - Initial and Periodic Monitoring

The regulations set forth at 29 C.F.R. 1910.1025(d)(2) and 1910.1025(d)(6)(ii) require monitoring for employee exposure to lead. An employer must carry out initial monitoring of his employees where they are exposed to lead. The results of this initial monitoring determines the need for follow-up action.

The lead standard applies by virtue of 29 C.F.R. 1910.1025(a)(1) to all occupational exposure to lead except construction work. The revised standard continues the scope of the original standard except for the stevedoring industry. Respondent's industry, scrap collection, as noted above, is specifically mentioned in the statement of reasons concerning the feasibility of complying with the lead standard for certain industries. There is no question that Respondent did not conduct either initial or follow-up monitoring in this case. The standard required initial monitoring at the very minimum at Respondent's workplace. The Secretary has established a violation of both 29 C.F.R. 1910.1025(d)(2) and 1910.1025(d)(6)(ii) under the circumstances of this case. The violation of item 1(b) is of course a technical one stemming from the Respondent's failure to conduct initial monitoring. The substantive violation is the failure to conduct any monitoring of the workplace.

### Item 2 - Housekeeping

The Secretary's Industrial Hygienist took several wipe samples in the area of Respondent's workplace where lead was handled. I have previously given my reasons for concluding the sampling results are reliable. They establish that Respondent failed to keep this area as free as practicable of accumulations of lead. Mr. Varkonyi has indicated that he did not clean up the area in anticipation of the

OSHA health inspection. The Secretary has presented a former employee who testified concerning his cleanup efforts prior to the inspection. It is not necessary to resolve the conflict, if any, between these individuals. There is no question that the housekeeping provisions of the regulations were violated by the failure to maintain the area. Mr. Varkonyi's reasons for not cleaning up will be considered in assessing an appropriate penalty for this violation. A violation of 29 C.F.R. 1910.1025(h)(1) has been established.

Items 3(a) & 3(b) - Medical Surveillance-Biological Monitoring

These items involve a slightly different issue. There is no question that the Respondent failed to institute a medical surveillance program or provide biological monitoring as set forth in the cited regulations. The regulations also indicate that these programs are only required for employees who are or may be exposed above the action level for more than 30 days per year. The issue to be resolved is whether the Secretary has established the 30 days per year requirement under the circumstances of this case.

Respondent argues that the Secretary failed to carry its burden of proof for two reasons. First it argues that OSHA should have taken another sampling before presuming that the employees exposed on the day of inspection may be exposed above the action level for more than thirty days a year. Secondly Respondent contends that the employees would not be exposed more than 30 days a year because they were not performing their usual duties at the time they were sampled.

Mr. Varkonyi's first contention must be rejected. Ms Heckmann acted reasonably in presuming the employees would be exposed for more than 30 days. She had previously taken wipe samples. She also conducted interviews on the subject with Respondent's employees. She interviewed Mr. Pinedo and understood

from him that he was performing his usual duties on that day. Consequently Respondent's contention must be rejected.

Respondent's second contention is essentially a factual matter. There is no conflict between Ms Heckmann and Mr. Varkonyi. Rather the question to be answered involves a resolution of the conflict between Respondent's former employee, Mr. Pinedo, and Mr. Varkonyi.

Mr. Varkonyi testified unequovically that he was aware that OSHA would be coming out for the air sampling portion of the inspection. He cancelled all pickups for that day and all outside jobs. He kept all the employees on the premises for the inspection.

Mr. Pinedo's testimony was somewhat conflicting. He testified on direct that his duties were about the same on the day in question. He did state he spent more time indoors on the day of the sampling. He also indicated that he spent his average time welding on that day. On cross-examination he acknowledged that his main duties at Respondent's warehouse involved welding. He worked mainly on outside work on the day prior to the inspection. This was consistent with his usual duties which required him to work on the outside. He acknowledged that on the day of the sampling he spent most of his time inside.

The undersigned has evaluated the testimony of these witnesses concerning the duties performed on the day of the air sampling inspection. I conclude that Mr. Varkonyi has the clearer recollection of the events. He was extremely sure of the facts. In addition a close look at Mr. Pinedo's testimony indicates that he corroborates Mr. Varkonyi's recollection of the events in most respects. Consequently Mr. Varkonyi has successfully rebutted the Secretary's case with respect to the 30 day requirement. The evidence of record does not establish that

the employees were performing their usual duties on that day. Consequently I cannot conclude that these employee, based on the one sampling, may be exposed for more than 30 days. Therefore items 3(a) & 3(b) must be vacated.

Item 4 - Training Program

29 C.F.R. 1910.1025(l)(L)(ii) requires a training program for all employees who are subject to exposure to lead at or above the action level. The specifics of the training program are spelled out in the regulation. There is no exception for intermittent exposure of less than 30 days as found in the medical surveillance provisions.

I previously held that OSHA's samples were reliable. They clearly show exposure above the action level on June 25, 1980. The items concerning medical surveillance and biological monitoring were vacated for a failure of proof that employees may be exposed above the action level for more than 30 days per year. This exception, as noted above, is not applicable with respect to training programs.

Mr. Varkonyi testified concerning his training program. It consisted of the presumption that every employee who handles lead knows that it is toxic. If they did not know it at the time they were hired, he tells them of the dangers of lead. This program does not meet the specific requirements noted in the regulation. Therefore Respondent was in violation of 29 C.F.R. 1910.1025(L)(2)(ii) at the time of the inspection.

It is noted that Respondent may need only to comply with 29 C.F.R. 1910.1025(L)(2)(i) after conducting future monitoring of its workplace. This provision provides that each employer who has a workplace in which there is a potential exposure to airborne lead at any level shall inform employees of the content of Appendices A and B of the regulation. The more detailed program is

addressed to situations where the action level is reached. This distinction is pointed out for future guidance to the Respondent as to the appropriate training program required under the regulations.

## Penalty Determination

I turn now to the assessment of an appropriate penalty for items 1(a), 1(b), 2 & 4. There is no question the combined violations are properly classified as a serious violation. Mr. Wingo's testimony fully explains the reasons for such a characterization. The Act requires the assessment of some penalty for a serious violation.

In determining the appropriate penalty in this case, there are several factors to be considered. Respondent is a very small employer and is normally exempt from all OSHA inspections except complaint inspections and health inspections. Respondent belongs to the National Association of Recycling Industries which has actively sought changes in the lead standard. Respondent has followed these challenges closely. The revised standard contains some of the suggestions of Respondent's trade group. The revised standard also specifically addresses the scrap collection industry in its statement of reasons and provides insight into OSHA's positions on various issues. I conclude that with this background a sizeable penalty is not appropriate in the case. Rather a nominal penalty of $1.00 is appropriate. The proposed penalty of $1600 is best applied toward the monitoring by Respondent of his workplace as required by my decision of the merits.

## Conclusions of Law

1. Respondent, Metal Recycling Company, is engaged in a business affecting commerce and has employees within the meaning of Section 3(5) of the Act. The Commission has jurisdiction of the parties and of the subject matter of this proceeding.

2. Respondent was in serious violation of 29 C.F.R. 1910.1025(d)(2); 1910.1025(d)(6)(ii); 1910.1025(h)(1) and 1910.1025(L)(1)(ii).

3. Respondent was not in violation of 29 C.F.R. 1910.1025(j)(1)(i) and 1910.1025(J)(2)(i).

## ORDER

On the basis of the foregoing Findings of Fact contained in the body of my decision and the above Conclusions of Law it is ORDERED that:

1. Items 1(a), 1(b), 2, and 4 of serious citation number 1 are affirmed and a penalty of $1.00 is assessed.

2. Items 3(a) & 3(b) of serious citation number 1 are VACATED.

So ORDERED.

OCCUPATIONAL SAFETY AND HEALTH REVIEW COMMISSION

1365 PEACHTREE STREET, N.E., SUITE 240

ATLANTA, GEORGIA 30309

# NOTICE OF DECISION

SECRETARY v. KECO INDUSTRIES, INC.

OSHRC Docket Nos. 81-1975 and 81-1976 (Consolidated)

1. Enclosed is a copy of my decision. It will be filed with the Commission on May 20, 1982, and will become the final order of the Commission on June 21, 1982, unless a Member of the Commission directs that it be reviewed.

2. You may petition for discretionary review of this decision by the Commission. A petition may be filed directly with me within twenty (20) days from the mailing of my decision. Thereafter, a petition should be mailed to the Executive Secretary, Attention:

   Chief Review Counsel
   Occupational Safety and Health Review Commission
   1825 K Street, N. W., Suite 601
   Washington, D. C. 20006

   Any petition filed directly with the Commission will be considered to the extent that time and resources permit. The last day the Commission may consider your petition is June 21, 1982. This final order date is fixed by law and cannot be extended under any circumstances.

3. If review is ordered by a Member of the Commission, each party to this case will be notified. In addition, each party will be given an opportunity to submit a brief to the Commission.

4. Please complete the enclosed postcard indicating whether you presently intend to seek review of this decision and mail the completed card promptly. Your response does not bind you in any way, but it assists the Commission in processing your petition when it is filed.

5. For any further details on the review process, see Commission Rules 90, 91, 92, and 93.

APPEARANCES:

Gary A. Boncella, Esquire, Office of the Solicitor, U. S. Department of Labor, Cleveland, Ohio, on behalf of the complainant.

Robert A. Adair, General Counsel, Keco Industries, Inc., Cincinnati, Ohio, on behalf of the respondent.

## DECISION AND ORDER

SPARKS, Judge: The two consolidated cases involving eight alleged violations of the Occupational Safety and Health Act (the "Act") were tried February 10—12, 1982, at Cincinnati, Ohio.

In addition to denying the violations and contesting the penalties, respondent affirmatively asserts "[t]hat the Citations and all actions of the Complainant associated therewith were, and are, vindictive and retaliatory and part of Complainant's continuing effort to harass, embarrass, and damage the Respondent because Respondent has successfully contested similarly groundless Citations . . . ."

Respondent is engaged in manufacturing sophisticated systems for air and space applications (Tr. 459-460).

I

ISSUES

1. Whether respondent violated 29 C.F.R. § 1910.303(a) by using conductors and equipment which had not been approved in that a circuit breaker box had a pigtail socket and socket fuse in place of a circuit breaker.

2. Whether respondent violated 29 C.F.R. § 1910.303(g)(2)(i) by failing to guard live parts against accidental contact in that covers of two electrical switch boxes were missing.

3. Whether respondent violated 29 C.F.R. § 1910.304(3)(1)(i) by failing to protect conductors and equipment from overcurrent in that two 15-amp fuse links were being used in lieu of the required one 15-amp fuse link for the #14 (AWG) gauge conductor in the service box for the Di-Acro press.

4. Whether respondent violated 29 C.F.R. § 1910.304(f)(4) by failing to have a permanent and continuous path to ground from the air conditioner located in the first floor lab office.

5. Whether the conditions described in paragraphs one through four, above, constitute serious violations.

6. Whether respondent violated 29 C.F.R. § 1910.106(e)(6)(ii) by dispensing Class I flammable liquids into containers without electrically interconnecting the nozzle and the container (Tr. 21).

7. Whether respondent violated 29 C.F.R. § 1910.303(f) by failing to have disconnecting boxes identified in that five boxes at column 11-C in the shop area were not marked.

8. Whether respondent violated 29 C.F.R. § 1910.305(g)(1)(iii)(a) by using flexible cord as a substitute for fixed wiring in that flexible cord for the Everett saw in the machine shop was not in conduit and was lying on the floor over a pile of material.

9. Whether respondent violated 29 C.F.R. § 1910.305(g)(1)(iii)(b) by using flexible cords in a prohibited manner in that the flexible cord to the air conditioner located in the lab was run through a wall to an electrical outlet in the next room.

10. The amount of penalty, if any, which is appropriate.

11. What are reasonable periods for abatement.

12. Whether respondent established in fact and in law its second defense which is alleged in its answer as follows:

> That the Citations and all actions of the Complainant associated therewith were, and are, vindictive and retaliatory and part of Complainant's continuing effort to harass, embarrass, and damage the Respondent because Respondent has successfully contested similarly groundless Citations in cases docketed under OSHRC Numbers 78-661, 79-4912, and 79-5145.

Without question respondent has been the object of numerous inspections under the Occupational Safety and Health Act. Mr. Cicchiani, the plant manager, estimated there had been 12 to 14 inspections in the last seven or eight years (Tr. 296). Representatives of OSHA stated there had been 11 inspections (Tr. 452). Respondent asserts these were caused by "a wrongful and insidious relationship between the OSHA and dissident employees . . ." (Tr. 302-305, 320-321).

It seems clear that the management-employee relationship is poor at Keco's plant (Tr. 66). There are allegations that the employees at Keco filed complaints of alleged violations with OSHA as a means of "getting back" at the company (Tr. 322-323). Whether the employees believed the company was unresponsive to safety complaints or whether employees merely wanted to harass the company is not established in the record (Tr. 58-59). The motive of the employees in filing complaints with OSHA is not a relevant issue in this proceeding (Tr. 84, 300-302). In its motion to quash the warrant, the allegations made by respondent were considered and rejected by the Magistrate and two judges of the United States District Court (Ex. J-1—J-4; Tr. 67, 411-413). The inspection warrant was sustained and led to the inspection which resulted in the citations at issue (Tr. 35-36, 52-55, 297, 361-362).

Respondent repeatedly suggests there was a plan "to get Keco" as evidenced by the dismissal of citations in OSHRC docket numbers 78-661, 79-4912 and 79-5145 (Ex. J-5, J-6), and the belated demand for and payment of $135 in penalties which respondent owed since 1975 (Ex. J-7; Resp. brief p. 13).

Respondent attempted to offer evidence concerning the reasons for Judge Chaplin's and Judge Taylor's orders and the motivation for complainant's effort to

collect the old outstanding penalty (Tr. 75-76, 305-306). Such evidence was ruled inadmissible as irrelevant and/or immaterial to the issues of this case (Tr. 84, 289-293, 411-423). Evidence was admitted which would bear directly on the credibility, bias or prejudice of witnesses in this case or would show the inspection was not conducted in a reasonable manner as required in section 8(a) of the Act (Tr. 16-19, 300-302, 307, 534-535). Respondent made several proffers of excluded evidence.

The evidence of record including testimony shows no bias or prejudice against respondent, nor does it reflect any unreasonable conduct by complainant or his agents during the inspection. The evidence establishes that complainant received complaints of alleged safety violations which he considered necessary to investigate (Ex. C-1; Tr. 59-64, 91, 298). The inspection resulted in findings of violations which caused the issuance of citations. Rather than demonstrating a plan to "get Keco", the record indicates the Secretary was merely performing his duty as he understood it to be (Tr. 143-144, 440, 445, 524-526).

## II

## FINDINGS OF FACT

1. Respondent is an employer subject to the Act.

2. An inspection of Keco's plant was undertaken as a result of three employee complaints of alleged safety and health violations at respondent's facility (Ex. C-1; Tr. 60-64).

3. Following an opening conference, a walkaround inspection was made on July 27, 1981. On the inspection team were Compliance Officers Washam and Gilgrist, Plant Manager Cicchiani, Plant Services Manager Howard and Union Representative Hustead (Tr. 37, 462).

4. During the walkaround inspection, Industrial Hygienist Richard T. Gilgrist observed three drums in a breezeway area. One drum contained toluene, one contained lacquer thinner and a third contained Stoddard solvent (Tr. 38, 45).

5. Toluene used at respondent's plant is a Class I flammable liquid (Tr. 47, 51).

6. Mr. Gilgrist did not see anyone pouring liquids from either of the drums. He did observe a detached nozzle of the type used to attach to 55-gallon drums in a pan of the Stoddard solvent which was below the drum marked Stoddard. It had a wire connected to it with an alligator clip on the end which is normally used for bonding purposes (Tr. 42, 45, 71, 80).

7. Painters use toluene and the lacquer thinner from the drums approximately every other day (Tr. 46).

8. A painter had not been trained to bond containers while pouring the liquid and did not maintain direct contact from one container to the other. A safety can was used which had a flame arrester, but it did not afford the protection of bonding (Tr. 47-48, 70-72).

9. The absence of bonding will permit an electrical spark which may jump between positively charged and negatively charged containers starting a fire (Tr. 48-49, 72-73, 79).

10. The painter did not as a practice hold one can directly in contact with the other container (Tr. 47-48).

11. The evidence does not firmly establish whether the nozzle with the alligator clips was used to effect a bond.

12. An electrical circuit breaker box located near a soldering area door

contained a "pigtail" electrical socket into which an electrical connection had been plugged (Ex. C-2, C-3; Tr. 93-95, 145, 166, 324, 327).

13. The "pigtail" had been plugged into an opening which would normally accommodate a circuit breaker switch. Such "pigtails" are customarily used to hook up a temporary light but in this case was equipped with a fuse and used as a power source for telephone switching gear (Tr. 93-94, 97-99, 100-101, 166).

14. The "pigtail" was not approved electrical equipment for the purpose for which it was being used (Tr. 97-98, 99, 227-228).

15. The circuit breaker box had been maintained in that condition for at least a year (Tr. 102, 174, 195-196).

16. Several hazards are presented by the unapproved use of the "pigtail". In order to change the fuse, because of its location in the box, it would be necessary for a person to pull out the fuse holder with his fingers which would be very close to live parts. There was no disconnect on the box and it was not readily accessible to employees in case of emergency. It was possible for a person to stick a finger into live parts although the likelihood of such an intentional act is remote (Tr. 168-171, 175-178, 187-188, 203-231, 240, 249, 284-285).

17. Although not approved equipment, the "pigtail" could operate as a fuse. If the box were properly covered and a disconnect switch provided, no danger is presented to persons working nearby or in the box (Tr. 252-254, 283-284).

18. At the time of the inspection, respondent had signed a contract to replace its telephone system which would include the entire connection. The installation had been completed by August 14 (Tr. 316, 327, 328, 330, 332, 362).

19. No work had been performed by the telephone company on Keco property to replace the switching equipment prior to July 1, 1981 (Tr. 363).

20. According to Mr. Andrews, the "pigtail" had been at Keco since about 1959 (Tr. 488).

21. An electrical motor starter switch located on the west wall of the welding area did not have a cover over the box (Ex. C-4; Tr. 103B, 107, 333, 368).

22. An electrical outlet located on column 11-A did not have a cover over the box. The receptacle was designed for voltages above 110 (Ex. C-5; Tr. 104, 235, 337).

23. Tests with a biomedical field probe and a volt meter established that the two boxes without covers contained live electrical current (Tr. 105-107, 109-111).

24. Employees were working in the areas near the boxes containing live electrical wiring and could come into contact with live parts (Tr. 107-111, 140, 179, 181, 188-189).

25. Respondent's managers frequently inspect the plant including verifying that covers are on outlets. The plant manager had passed the location of the boxes but had not seen the covers off. The compliance officer did not inquire about the covers or inform others during the inspection of the possible violation. Managerial employees inspect the plant frequently looking for items such as missing electrical covers. The evidence does not show that Keco knew or could have known of the condition (Tr. 180-181, 182-185, 333-336, 339-340, 371).

26. Exposure to live parts by any person at the breaker box containing the "pigtail" and at the two uncovered boxes presents the possibility of death or serious injury (Tr. 189-191, 195, 237-239).

27. Metal bandings when cut can travel through the air and enter uncovered electrical boxes (Tr. 263).

28. Mr. Cicchiani's testimony that the cover for the on/off switch for the fan was on the floor after having been left there "either a few hours or the evening before . . ." is reasonable since work was being performed on the equipment (Ex. R-6, R-7; Tr. 333, 335-336, 343).

29. The covers were replaced during the final conference (Tr. 268).

30. The electrical switch box which services the Di-Acro press contained three cartridge fuses each of which contained two replaceable 15-amp fuse links (Ex. C-6, C-7; Tr. 112, 345).

31. The compliance officer testified that a hazard was present because the conductor wiring was rated for only a 15-amp fuse and the effect of the two replaceable 15-amp fuses was approximately 30 amps (Tr. 116, 118, 156).

32. The compliance offier was informed by one of respondent's electricians that the wiring was 14 gauge size under the American Wire Gauge (AWG) and the type was THHN (Tr. 117, 152-153, 164, 197).

33. According to Table 310-12 of the National Electric Cde, the maximum fuse capacity for 14-gauge wire (AWG), type THHN, is 15 amps (Ex. C-8; Tr. 120-122, 244-245, 268, 272).

34. The Di-Acro press required the protection of a 30-amp fuse (Tr. 151, 359).

35. A 30-amp fuse would provide appropriate protection for 10-gauge wire (AWG), type THHN (Tr. 154).

36. A 10-gauge wire is adequately protected by a 20-amp fuse (Tr. 260, 270).

37. The wire serving the Di-Acro press was actually 10 gauge THW 600 volt (Ex. R-9; Tr. 274-276, 354,512).

38. The 30-amp fuse is adequate protection for the 10-gauge wire servicing the Di-Acro press (Tr. 275, 356).

39. Mr. Joseph L. Zimmerman measured the wire servicing the Di-Acro press and determined that each lead was .105 inches in diameter. By reference to the Machinist's Handbook and with the assistance of Mr. Andrews, respondent's president, he determined that the wire was 10 gauge (Ex. R-10; Tr. 397-401).

40. Mr. Andrews, respondent's president and a graduate engineer, determined that the wire servicing the Di-Acro press was 10 gauge (Tr. 471-476).

41. The independent electrician who replaced the wiring to the Di-Acro press determined that the wire he removed was 10 gauge (Tr. 512).

42. An air conditioner located in the laboratory office area was plugged into a three-prong electrical outlet, but the power cord itself only had two prongs. There were no bonding straps to conduit or grounding rods (Ex. C-9, C-10; Tr. 123, 126).

43. The electrical grounding of the air conditioner was tested by the compliance officer by use of a ground loop impedance tester. The test resulted in a "flickering light" indicating there was not a constant ground (Tr. 128, 186-187, 278, 281-282, 357, 379-380).

44. Complainant's expert witness, Mr. Bland, was of the opinion that an air conditioning circuit which produced a flickering light on the ground loop impedance tester could give an electrical shock to a person coming in contact with it (Tr. 264-247).

45. Mr. Andrews, respondent's president and a highly qualified engineer in heating and air conditioning, was of the opinion the air conditioning unit was

adequately grounded as it was in a metal frame which in turn was in contact with the metal beams of the building which were grounded (Tr. 479, 499, 500-501).

46. Greater weight is given to the tests performed by the compliance officer and it is found that the air conditioning unit was not grounded continuously (Tr. 248).

47. Complainant offered the testimony of Mr. Larry P. Bland who was qualified by his knowledge, skill, experience and training as an expert in electricity and electrical maintenance (Tr. 214, 223-225).

48. The electrical cord for the air conditioning unit located in the laboratory office ran through a hole in the wall to an outlet in an adjacent room or hallway (Ex. C-9, C-13; Tr. 137-138, 483).

49. A flexible cord run through a wall presents a hazard in that the insulation may break down and not be observed. An electrical short could result in starting a fire (Tr. 138).

50. Four electrical disconnect boxes located on a wall near the paint spraying area were not marked or identified as to the purposes of the boxes and the purpose was not evident by their location (Ex. C-11, C-12, C-13; Tr. 129-130, 132, 480).

51. Employer representatives on the walkaround inspection could identify the equipment served by two of the boxes but did not know the purposes of the other two boxes (Tr. 131).

52. The hazard presented to workers nearby is they would not be able to quickly locate the disconnect box in case of an emergency (Tr. 132-133).

53. A flexible electrical cord, approximately 20 feet in length which

provided power to an Everett saw, was not conduit and was stretched across a stack of aluminum stacks (Ex. C-12; Tr. 133).

54. The Everett saw remains at its location in the machine shop but must be repositioned as much as ten feet to handle different types of materials (Tr. 135, 481-482).

55. The flexible cord was a tripping hazard to employees in the area and presents a potential shock hazard in the event the insulation becomes worn or damaged (Tr. 135-316).

III

DISCUSSION

A. OTHER CITATION 1, ITEM 1
(OSHA Citation Number G6639 197 [Tr. 431])

The only item alleged in docket number 81-1975 charges that respondent violated 29 C.F.R. § 1910.106(e)(6)(ii) by dispensing Class I flammable liquids into containers without electrically interconnecting the nozzle and the container.

Section 1910.106(e)(6)(ii) of 29 C.F.R. provides as follows:

> Grounding. Class I liquids shall not be dispensed into containers unless the nozzle and container are electrically interconnected. Where the metallic floorplate on which the container stands while filling is electrically connected to the fill stem or where the fill stem is bonded to the container during filling operations by means of a bond wire, the provisions of this section shall be deemed to have been complied with.

Toluene and lacquer thinner are used by painters about every other day. Toluene is a Class I flammable liquid to which the cited provisions apply.

The compliance officer did not see the liquid being poured but by talking with a painter learned that he had not received training regarding bonding, used a safety

can while pouring the liquid and did not regularly make contact between the containers while pouring.

The compliance officer had observed a nozzle and wire of the type used to effect bonding and the record does not affirmatively negate the possibility that it was used while pouring toluene (Tr. 45). The evidence is insufficient to make a prima facie showing of noncompliance and the citation must be vacated.

B. SERIOUS CITATION 1, ITEM 1
(OSHA Citation W8484 184)

Item one alleges a serious violation in that an unapproved "pigtail" was used in a circuit breaker box. The cited regulation, 29 C.F.R. § 1910.303(a), provides as follows:

> Approval. The conductors and equipment required or permitted by this subpart shall be acceptable only if approved.

The evidence establishes that an unapproved "pigtail" was in use which created a hazard for employees who had to service the box and also exposed workers nearby to the hazard. Respondent implies the "pigtail" was in the box for only a short period of time and had been placed there by employees of the telephone company. The weight of the evidence supports the finding, however, that the "pigtail" had been in use for at least a year and respondent knew or should have known of the condition. The violation has been proved.

C. SERIOUS CITATION 1, ITEM 2

Item two of the serious citation is based on the observation that two electrical boxes containing live parts were observed and photographed during the walkaround inspection (Ex. C-4, C-5).

Section 1910.303(g)(2)(i) of 29 C.F.R. provides:

> Guarding of live parts. (1) Except as required or permitted elsewhere in this subpart, live parts of electric equipment operating at 50 volts or more shall be guarded against accidental contact by approved cabinets or other forms of approved enclosures, or by any of the following means:

Respondent acknowledges the boxes were uncovered at the time of the inspection but contends the covers were on the floors nearby where they had been placed by mechanics working on the boxes either earlier that morning or the day before. The covers were not seen on the floor by the compliance officer, but neither did he ask the company official about the location of the covers or advise them of his observations about the missing covers. Mr. Bland, complainant's expert witness, acknowledged that it was a common practice for workmen to place a cover below where work was being performed and to fail to immediately replace the cover after the work was completed (Tr. 265). Evidence is lacking that the company knew or should have known of the violative conditions as required by section 17(k) of the Act. A serious violation cannot be sustained and the item is vacated.

D. SERIOUS CITATION 1, ITEM 3

Complainant alleges that the cartridge fuses for the Di-Acro press provided inaequate protection and therefore violated 29 C.F.R. § 1910.304(e)(1)(i) which provides:

> Overcurrent protection. (1) 600 volts, nominal, or less. The following requirements apply to overcurrent protection of circuits rated 600 volts, nominal, or less.
>
> (i) Protection of conductors and equipment. Conductors and equipment shall be protected from overcurrent in accordance with their ability to safely conduct current.

The preponderance of evidence establishes, however, that the wiring was not 14 gauge but 10 gauge (AWG) and was adequately protected by the two 15-amp link fuses. Accordingly, the item will be vacated.

E. SERIOUS CITATION 1, ITEM 4

Complainant alleges that the air conditioner was not adequately grounded constituting a violation of 29 C.F.R. § 1910.304(f)(4) which provides as follows:

> Grounding path. The path to ground from circuits, equipment, and enclosures shall be permanent and continuous.

Although the opinion of Mr. Andrews that the ground was adequate is entitled to considerable weight, he did not perform any tests. The tests performed by the compliance officer indicated the ground was not permanent and continuous and are convincing that a violation existed and will be affirmed. The conditions create the hazard of an electrical shock and could cause death or serious bodily injury. Keco could and should have become aware of the conditions by performing similar tests.

F. OTHER CITATION 2, ITEM 1

The citation alleges that disconnect boxes were not adequately marked in order to determine their purposes, thereby violating 29 C.F.R. § 1910.303(f) which provides:

> Identification of disconnecting means and circuits. Each disconnecting means required by this subpart for motors and applicances shall be legibly marked to indicate its purpose, unless located and arranged so the purpose is evident. Each service, feeder, and branch circuit, at its disconnecting means or overcurrent device, shall be legibly marked to indicate its purpose, unless located and arranged so the purpose is evident. The markings shall be of sufficient durability to withstand the environment involved.

Four disconnect boxes at column 11-C were not marked so as to determine the purposes of the boxes and were not so located or arranged so that the purposes were evident (Ex. C-11). Company officials on the walkaround could state the purposes of two boxes but not the other two. An "other than serious" violation is established.

G. OTHER CITATION 2, ITEM 2

The flexible cord to the Everett saw was an improper substitute for fixed wiring under the conditions proved in the record. A violation of 29 C.F.R. § 1910.305(g)(1)(iii)(a) is established. The section provides as follows:

> Unless specifically permitted in paragraph (g)(1)(i) of this section, flexible cords and cables may not be used:
> (a) As a substitute for the fixed wiring of a structure;

Even if it is necessary to move the saw as much as ten feet, only a much shorter flexible cord would be warranted. The conditions show a violation of the cited regulation.

H. OTHER CITATION 2, ITEM 3

The compliance officer observed that flexible cord from an air conditioner was run through a wall to an outlet in an adjoining room or hallway. The condition was cited under 29 C.F.R. § 1910.305(g)(1)(iii)(b) which provides:

> Unless specifically permitted in paragraph (g)(1)(i) of this section flexible cords and cables may not be used:
>
> * * *
>
> (b) Where run through holes in walls, ceilings, or floors;

It is not disputed that the condition existed as described by the compliance officer. A violation has been established.

## IV

## PENALTIES

In considering the appropriate penalty, complainant determined respondent had approximately 300 employees and did not adjust the penalty due to the size of the employer. Because of several prior inspections, no adjustment was made due to prior history. A reduction of 20% was made, however, on the grounds the respondent had exhibited "good faith" (Tr. 139, 141-143).

For the two serious violations of citation one which were found to have been proven, the Secretary proposed penalties of $320 for item one and $240 for item four.

Item one involved the unapproved "pigtail" in the circuit breaker box. It was shown the condition had existed for a long period of time. Although the chances of an accident were not great, the consequences, if an accident did occur, electrical shock, would likely be death or very serious injury. A penalty of $320 is reasonable considering all the conditions.

Item four concerned the inadequately grounded air conditioner. Again the consequences of an electrical shock would likely be death or very serious injury. The air conditioner was operated only in the summer so the time employees were exposed to injury was not as long. Also, the hazard would not be as readily apparent to management as would the unapproved "pigtail". The proposed penalty of $240 is appropriate.

V

## ABATEMENT

At least one of the conditions found to be in violation of the Act, serious citation one, item one, use of the unapproved "pigail", was abated prior to the date of the hearing.

The remaining violations can and should be abated within ten days following the date this order becomes final. Materials necessary to abate the conditions are readily available and the labor required to make such corrections would not be prohibitive.

VI

## CONCLUSIONS OF LAW

1. The Review Commission has jurisdiction of the parties and the subject matter.

2. The respondent violated 29 C.F.R. § 1910.303(a) and 29 C.F.R. § 1910.304(f)(4) under conditions constituting serious violations of the Act.

3. Penalties of $320 and $240 are appropriate for the violations.

4. The respondent violated 29 C.F.R. § 1910.106(e)(6)(ii), 29 C.F.R. § 1910.305(g)(1)(iii)(a) and 29 C.F.R. § 1910.305(g)(1)(iii)(b) under conditions constituting other than serious violations of the Act.

5. No penalty is appropriate for the other than serious violations.

6. Respondent did not violate other citation one, OSHA number G6639 187, item one.

7. Respondent did not violate 29 C.F.R. § 1910.303(g)(2)(i) and 29 C.F.R. § 1910.304(e)(1)(i) of serious citation one.

8. Abatement periods extending ten days beyond the date of the final order are reasonable and appropriate.

## ORDER

It is ORDERED:

1. Other citation one, item one, OSHA # G6639 187, is vacated.

2. Serious citation one, item one, is affirmed and a penalty of $320 is assessed.

3. Serious citation one, item two, is vacated.

4. Serious citation one, item three, is vacated.

5. Serious citation one, item four, is affirmed and a penalty of $240 is assessed.

6. The following other than serious violations are affirmed without penalty:

   (a) Other citation two, item one

   (b) Other citation two, item two

   (c) Other citation two, item three

7. All violations shall be abated within ten days after this order becomes final.

Dated this 20th day of May, 1982.

JOE D. SPARKS
Judge

UNITED STATES OF AMERICA

# OCCUPATIONAL SAFETY AND HEALTH REVIEW COMMISSION

1515 Broadway, Room 3800
New York, New York 10036

## NOTICE OF DECISION

Secretary of Labor v. KENNETH J. HERMAN, INC.
OSHRC Docket No. 81-1664

1. Enclosed is a copy of my decision. It will be filed with the Commission on May 25, 1982, and will become the final order of the Commission on June 24, 1982, unless a Member of the Commission directs that it be reviewed.

2. You may petition for discretionary review of this decision by the Commission. A petition may be filed directly with me within twenty (20) days from the mailing of my decision. Thereafter, a petition should be mailed to the Executive Secretary, Attention:

   Chief Review Counsel
   Occupational Safety and Health Review Commission
   1825 K Street, N.W., Suite 601
   Washington, D.C. 20006.

   Any petition filed directly with the Commission will be considered to the extent that time and resources permit. The last day the Commission may consider your petition is June 24, 1982. This final order date is fixed by law and cannot be extended under any circumstances.

3. If review is ordered by a Member of the Commission, each party to this case will be notified. In addition, each party will be given an opportunity to submit a brief to the Commission.

4. Please complete the enclosed postcard indicating whether you presently intend to seek review of this decision and mail the completed card promptly. Your response does not bind you in any way, but it assists the Commission in processing your petition when it is filed.

5. For any further details on the review process, see Commission Rules 90, 91, 92, and 93.

DAVID G. ORINGER
JUDGE, OSHRC

Appearances:

FOR THE SECRETARY OF LABOR

Francis V. LaRuffa, Regional Solicitor;
William G. Staton, Esq., of Counsel,
U. S. Department of Labor
1515 Broadway, Room 3555
New York, New York 10036

FOR THE RESPONDENT

Kenneth J. Herman, President
Kenneth J. Herman, Inc.
67 Albany Avenue
Amityville, New York 11701

DECISION AND ORDER

ORINGER, JUDGE: This a proceeding under Section 10(c) of the Occupational Safety and Health Act of 1970, 29 U.S.C. 651, et seq., (hereinafter referred to as "the Act"), to review a citation issued by the Secretary of Labor, (hereinafter sometimes referred to as "Complainant"), pursuant to Section 9(a) of the Act, and a proposed assessment of penalties thereon issued, pursuant to Section 10(a), of the Act.

This cause arose as a result of one citation being issued against the Respondent by the Complainant, alleging a serious violation of the standard set forth at 29 CFR 1926.500(d)(1) and proposing a penalty of $250.00 therefor.

The description of the allegation of violation in this case reads as follows:

CITATION NO. 1 FOR SERIOUS VIOLATION

| Standard, Regulation or Section of the Act Allegedly Violated | Description of Alleged Violation |
|---|---|
| 29 CFR 1926.500(d)(1) | Open-sided floors or platforms, 6 feet or more above adjacent floor or ground level, were not guarded by a standard railing or the equivalent on all open sides:<br><br>38-18 Queens Boulevard, 2 extension trestles used to support aluminum platform, 10' 6" high 12" wide and 24' long - spanning a 22' distance, outboard side exposed. [sic] |

TEXT OF THE STANDARD INVOLVED HEREIN

| Standard, Regulation or Section of the Act Allegedly Violated | Text of Standard |
|---|---|
| 29 CFR 1926.500(d)(1) | 500(d) Guarding of open-sided floors, platforms, and runways<br><br>1. Every open-sided floor or platform 6 feet or more above adjacent floor or ground level shall be guarded by a standard railing, or the equivalent, as specified in paragraph (f)(i) of this section, on all open sides, except where there is entrance to a ramp, stairway, or fixed ladder. The railing |

| Standard, Regulation or Section of the Act Allegedly Violated | Text of Standard |
| --- | --- |
| 29 CFR 1926.500(d)(1) (Cont'd) | shall be provided with a standard toeboard wherever, beneath the open sides, persons can pass, or there is moving machinery, or there is equipment with which falling materials could create a hazard. |

## THE ISSUES

1. Whether or not the Respondent, Kenneth J. Herman, Inc., was in violation of the standard set forth at 29 CFR 1926.500 (d)(1)?

2. In the event that a violation by this Respondent is found proven, of the standard set forth at 29 CFR 1926.500(d)(1), was the violation properly characterized as "serious"?

3. In the event a violation is found proven, what is the appropriate penalty?

## STATEMENT OF THE CASE

The instant case has an unusual history. The case was originally tried before Judge James P. O'Connell, who left the Commission prior to writing a decision. Subsequent to his leaving the Commission, the case was reassigned to the undersigned.

This tribunal offered the parties three choices. In the first instance, they could settle the case; in the

second instance, they could waive credibility findings and allow the undersigned to render a decision on the record or they could exercise a third option and have the case retried. The parties opted for re-trial of the case. This tribunal advised both sides on the record, that in the event there was a conflict of testimony between the original record and the record made before this tribunal, such discrepancies might well be considered. No essential discrepancies having been found or claimed by the parties, any credibility findings made are on the strength of the record made in the proceeding before this tribunal.

The president of the corporation represented the Respondent in a competent manner.

OPINION

In this case, the Respondent was placing a metal front on a one-story bank building.

On his arrival at the worksite, the compliance officer observed two employees of the Respondent working on a platform made of aluminum approximately 24 feet long and 1 foot wide which had no fall protection for anyone working on the platform. The span of the platform was approximately 22 feet in length. At either end of the platform it was suspended between an A-frame ladder reinforced by a trestle ladder on each side.

The compliance officer testified and the Respondent's witnesses do not dispute that when the Secretary's representative

first viewed the platform and the men working on it, there was no fall protection whatsoever.

It is the Respondent's argument that he only sends up safe people to work on the scaffold and they know how to handle themselves when working with height. He also argued that to put guardrails on a one foot wide platform would not give them enough room to work and a wider platform would be hazardous because public passing by might bump in to it.

The standard specifically requires that every open-sided platform six feet or more or above adjacent floor or ground level, shall be guarded by a standard railing or the equivalent. Accordingly, giving the Respondent the best of the evidence, a violation existed. Guardrails would not have made the job impossible of performance, nor would it have increased the hazard of working on the platform.

Moreover, Respondent's president admitted in the first trial of this cause before Judge O'Connell and in the instant cause before the undersigned, that the proper type of scaffold for this job was a rolling scaffold which contained guardrails on each side. Thus, the evidence is clear and unequivocal that the Respondent knew how to abate such a fall hazard. Certainly the fact that the Respondent claims that the foreman in charge of this job has not been involved in a fall accident previously, is no defense to the citation.

The record does reflect that Respondent is a safety-minded employer, uses the newer type tools, tries to keep the best equipment but in this case Respondent clearly violated the standard despite knowing a proper method of abating the hazard. Accordingly, the Secretary has proven the violation.

The Respondent knew of the lack of protection against fall hazards.

In the event of an accident, serious injury could have occurred. Certainly a fall in excess of six feet and in this case what appears to be approximately ten feet could well have resulted in death or serious injury. Accordingly, the violation proven must be characterized as serious.

Insofar as penalty is concerned, the employer's safety-mindedness is clear. It does use the newest equipment and tools, attempts to keep equipment that complies with OSHA and, accordingly, such conduct must be taken into consideration when assessing a penalty.

In view of all of the elements involved and the type of operation run by the Respondent, this tribunal finds a penalty of $100.00 reasonable and appropriate in the premises. The Respondent must heed this caveat however, in the future, in the event it must use a narrow scaffold such as this one, it must use the rolling scaffold described by the Respondent's President Herman as the proper type of equipment on a job such as this one, if it deems the platform too narrow to equip it with standard guardrails.

The record reflects that both Mr. Giangreco, the Secretary's representative and Messrs. Stetson and Herman, the Respondent's witnesses possess long years of experience in the construction field. The Secretary's representative has, in addition, training in the safety area. The standard is unequivocal in its requirements and the evidence is incontrovertible insofar as the lack of fall protection is concerned. Accordingly, the violation was proven. The testimony of record also reveals that a fall of ten feet to a concrete ground below which was a possibility in this case, could result in death or serious physical harm. Accordingly, the violation was proven to be serious.

Insofar as abatement is concerned, assuming the Respondent did not desire to use standard guardrails on either side of a one-foot wide platform as well as on the two ends, it could have used the rolling platform described by the Respondent which contained guardrails and thus fall protection for men working thereon. Certainly the rolling platform would have been a feasible means of abatement as it was described by Mr. Herman during his testimony.

The Respondent's defense pointed out that Stetson felt safe on the scaffold. This is a poor argument in view of the standard here involved and its explicit requirements, particularly in view of the fact that President Herman himself, on page 94 of the transcript stated that "the whole

scaffold [sic] should have been scrapped for safety reasons . . ." Mr. Herman's candidly honest testimony reflected his opinion of the platform as unsafe and page 95 of the transcript disclosed his opinion that a rolling scaffold 2 to 2 1/2 feet with guardrails would have abated the hazard.

The method of abatement described by Mr. Herman may have been superior to that suggested by the compliance officer, Mr. Giangreco, but that does not obviate the fact that a hazard existed that violated the standard. Accordingly, the allegation of violation of the standard set forth at 29 CFR 1926.500(d)(1) must be affirmed.

Having heard the testimony and observed the demeanor of the witnesses and having considered the same, together with the citation, notification of proposed penalty, notice of contest, pleadings, representations, stipulations and admissions of the parties, it is concluded that the preponderance of the credible evidence of record supports the following

## FINDINGS OF FACT

1. The Respondent, Kenneth J. Herman, Inc., is incorporated in the State of New York and does business in the entire tri-state area (Tr. 5 & 6).

2. The Respondent never filed for a variance from the standard set forth at 29 CFR 1926.500(d)(1) (Tr. 10).

3. At the time of the inspection herein concerned, the Respondent was placing a metal front on an existing store front on a one-story building that was occupied by a bank (Tr. 16).

4. The employees were cutting metal pieces to size and taking the metal pieces up a ladder and installing them on the building utilizing an electric drill with a screwdriver head (Tr. 16).

5. The two employees of the Respondent who were working were at a height of approximately 10 feet 6 inches off the ground. The platform was approximately 1 foot or 12 inches wide and had 22 feet in length as working space. The platform was between the beams on A-frame ladders reinforced by trestle ladders stabilizing the ends of the platform (Tr. 17).

6. The platform had no fall protection whatsoever (Tr. 30 and 80).

7. It was the opinion of the Respondent's president that the whole scaffold was unsafe and should have been scrapped for safety reasons (Tr. 94).

8. In the opinion of the Respondent's president, the safest method of working would have been with a rolling scaffold provided with guardrails (Tr. 95).

9. The Respondent however, did not use a rolling scaffold with guardrails at the time that the inspection took place and in fact the platform had no fall protection whatsoever (entire record).

Based on the aforementioned findings of fact, opinion and the entire record, the Judge makes the following

CONCLUSIONS OF LAW

1. At all times herein mentioned, the Respondent, Kenneth J. Herman, Inc., was engaged in a business that affected commerce within the meaning of Section 3(5) of the Occupational Safety and Health Act of 1970 and this tribunal has jurisdiction to hear and decide the within controversy.

2. This Respondent, at the time of the inspection herein concerned, was in serious violation of the standard set forth at 29 CFR 1926.500(d)(1) and a penalty of $100.00 is appropriate therefor.

O R D E R

In view of the foregoing, good cause appearing therefor, it is ORDERED that:

The allegation of serious violation by this Respondent, of the standard set forth at 29 CFR 1926.500(d)(1), is AFFIRMED and a penalty of $100.00 is ASSESSED therefor.

SO ORDERED.

DAVID G. ORINGER, JUDGE, OSHRC

| Respondent. | : | |

DECISION

Before: ROWLAND, Chairman; CLEARY and COTTINE, Commissioners.

BY THE COMMISSION:

An employee of Respondent, Jones & Laughlin Steel Corporation ("J&L"), was killed in an accident involving an overhead electric crane at J&L's Aliquippa, Pennsylvania steel mill. The Secretary of Labor ("Secretary") issued a citation charging that J&L had violated section 5(a)(1), 29 U.S.C. § 654(a)(1), of the Occupational Safety and Health Act of 1970, 29 U.S.C. §§ 651-678 ("the Act").[1/] The citation alleged that J&L had not instructed its motor inspectors in Stripping Yard Crane No. 7 concerning proper crane boarding procedures and hazards associated with improper crane boarding.[2/] A penalty of $800 was proposed. Administrative

---

1/ Section 5(a)(1) of the Act provides that "[e]ach employer . . . shall furnish to each of his employees employment and a place of employment which are free from recognized hazards that are causing or are likely to cause death or serious physical harm to his employees."

2/ The Secretary's complaint amended the citation to add the following language:

> and there was not on that date, nor prior thereto, a safety program with systematically enforced work rules which would effectively compel the motor inspectors and other employees exposed to hazards associated with the boarding of cranes to follow safety procedures directed to those hazards.

Law Judge Joseph Chodes vacated the citation on the basis that J&L had adequately instructed its employees on proper procedures and that the Secretary failed to show that J&L had not taken adequate measures to implement its crane boarding safety rules. For the reasons set forth below, we affirm.

I.

J&L's Aliquippa Works, a vast facility, occupied a site six miles long and employed 11,000 employees. Its operations were organized into about 120 divisions, each headed by a general foreman. There were more than 100 overhead cranes at the facility.

On the morning of the fatality, motor inspectors John Plonka and Blaise Churney were assigned to change the ram brake shoes of electric crane No. 7, located in the stripper yard. Crane No. 7, a "stripper" crane, was a large overhead crane sixty feet wide mounted on parallel runways between forty and sixty feet above the ground. The ram brakes were on the crane above the level of the runways. The cab from which the crane operator controlled the crane was twenty to thirty feet below the level of the runways and twenty to thirty feet above the ground.[3/]

The job classification of motor inspector, to which Plonka and Churney were assigned, was a "sixteen point" job, the highest level non-supervisory job in J&L's maintenance department. To attain this position, an employee had to work his way up a series of maintenance jobs and pass a battery of tests. Motor inspectors performed crane inspection, troubleshooting, and electrical repairs. Plonka had been a motor inspector for about twenty years. Churney, a motor inspector for one year, had worked on overhead electric cranes for about eight years and had a total of fifteen years with J&L.

---

3/ Two witnesses gave varying estimates of the height of the crane cab and the runways.

After receiving instructions to change the brake shoes from Fred D'Antonio, crane repair foreman, Plonka and Churney proceeded to the crane boarding station, where they waited for the brake shoes to be brought to them. The boarding station was twenty to thirty feet above the ground, the same height as the crane operator's cab. After waiting for some time without receiving the brake shoes, the two employees walked up a stairway to one of the crane runways. The motor inspectors waited while the crane, approximately 100 yards away, cleaned up the yard with a magnet. When it appeared that the No. 7 crane was not going to return to the boarding station, which it normally did upon the completion of a particular task, Plonka and Churney started to walk north along the runway towards the crane.[4/] The crane was above a "drag," several molds filled with hot steel, that was to be stripped by the crane. At that point, foreman D'Antonio noticed the two motor inspectors on the runway and told them to "hold up." D'Antonio called the operator of crane No. 7 to come out of the crane cab. After determining that the drag was to be stripped before the brake shoes were to be changed, D'Antonio instructed the motor inspectors to go to the south corner and wait for the crane. According to D'Antonio, Churney and Plonka acknowledged him by shaking their hands and nodding their heads.[5/]

Plonka and Churney remained on the runway, however, and watched the stripping operation for a short time. Then they decided to board the crane.

---

4/ By this time, the brake shoes had arrived. For reasons not explained, however, Plonka and Churney moved to board the crane without the brake shoes.

5/ The crane operator testified that the two motor inspectors were instructed to go to the south corner and to wait for him to finish stripping the drag. He observed Plonka and Churney start to walk toward the south end. Churney, however, did not recall being told to wait at the south end of the runway. Although D'Antonio was standing 40 to 60 feet below the two motor inspectors, both D'Antonio and Churney testified that they had no difficulty hearing each other.

Churney, "knowing" that the crane would not move when it was over a mold, walked onto the crane. Upon reaching the trolley of the crane, Churney attempted to ask the crane operator to stop the crane so that Plonka could board. However, the crane's speaker system was not functioning and the crane continued moving from mold to mold stripping the steel ingots. Plonka, apparently thinking that the crane had stopped, walked up the crane runway. However, the crane moved toward Plonka, and he was pinned between the crane bridge guardrail and an adjacent upright column along the runway. Plonka died of the injuries he sustained.

At the hearing, J&L admitted that it was a recognized hazard for an employee to board a crane without notifying the crane operator. To protect against this hazard, J&L had a work rule requiring its employees to notify the crane operator whenever they intended to board a crane. After such notification, the crane operator was required to turn the main electric switch of the crane off and to observe the employees boarding the crane. J&L equipped its cranes with red and green lights which indicated whether the crane is energized.

J&L's work rules also required employees to board cranes only from designated boarding platforms and prohibited employees from walking upon crane runways unless authorized to do so by the "person in charge." However, when a crane was broken down in a location away from the boarding platform, it was necessary for repair personnel to board a crane from the crane runways. Motor inspectors, in performing repairs, did not need to obtain permission from their foreman each time they walked on the crane runways, but they still were required to notify the crane operator prior to boarding a crane.

J&L's safety rules and procedures relating to cranes were contained in a booklet entitled, Safety Rules for Electric Overhead Traveling Cranes or Gantry

Crane Operators, Crane Directors, Hook-up Men, Repairmen (Cab Operated). Instructions in the booklet relating to boarding cranes were comprehensive and unambiguous. The booklet, first prepared in 1949 and updated periodically, was available in various units of J&L where such rules would apply and was also referred to on a sign, "Notice to Crane Operators," which was posted in every crane cab. The booklet was also, at least to some extent, distributed to individual employees. Plonka was issued a copy of this booklet in 1952. Three employees testified that they received copies of this booklet when they began working in the stripper yard, in each instance over 20 years previously. Churney and two other employees, however, testified that they never received the booklet.

Employees experienced in crane operations testified that they knew the crucial crane boarding rules and procedures, including use of prescribed boarding areas whenever possible in getting on and off cranes, notification of the crane operator before boarding a crane, and the requirement that cranes not be boarded when the green indicator light was on. For the most part, the employees' knowledge of the safety rules was acquired on the job by observation of and discussion with other employees. Several employees, however, further testified that on occasions they boarded cranes without notifying the crane operator, but that they knew they were violating J&L's safety rules. Two crane operators, Kozlina and Bielorucki, testified that violations of crane boarding rules occurred about 10% of the time.[6/]

Churney and another motor inspector stated that they knew they were violating J&L's safety rules when they boarded cranes without notifying the crane operator.

---

6/ Millwright helper Mancini testified that he boarded the crane from the crane runway about 85% of the time. However, he generally boarded a crane only after it was deenergized for repairs. Mancini also testified that he rarely worked in the stripper yard.

They both expected discipline or a reprimand if a violation was discovered. Kozlina and Bielorucki also expected that employees would be reprimanded if management learned about crane boarding violations. Kozlina testified that, when employees had boarded his crane without notification, he had become angry and told them "I don't care for it." However, he did not notify management about such violations because he did not want to "squeal" on employees and get them in trouble.

The superintendent of the Aliquippa Works and the crane repair foreman testified that, prior to the accident, they had never observed or known of any crane boarding violations. The superintendent testified that, although there was an average of two supervisors in the stripper yard for each shift, discovery of crane boarding violations was difficult because employees were reluctant to report violations to management, and it would be hard to come across an unreported violation. If employees failed to comply with J&L's safety regulations, they were verbally reprimanded, and, in more serious cases, disciplined with "written reprimands, time off, further suspension, and even termination." Discipline procedures were provided in the union contract, and salaried supervisory employees also had been disciplined for safety violations.

J&L's safety program at its Aliquippa Works included safety seminars attended by persons selected by union and management, the posting of signs around the plant, and awards to divisions with the best housekeeping. A field safety inspector, whose duties were to attend safety meetings, look for unsafe practices, and review accident reports, was assigned to the Steel Works Department and reported to J&L's safety administrator. A joint labor-management safety and health committee also met monthly.

Supervisory employees and foreman D'Antonio testified that superintendents held monthly safety meetings with general foremen. The general foremen met

monthly with the foremen under their direction, who in turn were required to hold two safety meetings per month. However, some of J&L's employees testified that safety meetings were held less frequently.

The general foreman of each plant division was required to make a job safety analysis each month of some operation within the division. A job safety analysis of crane No. 7 had not been done before the accident because the crane had been in operation only five months.

Compliance Officer O'Matz testified that a crane boarding fatality occurred at J&L's Pittsburgh plant in 1973.[7/] That fatality involved a "trainee-type" person who was crushed between the crane and a column when he was attempting to board a moving crane. No citation was issued under section 5(a)(1) of the Act as a result of that incident. Safety administrator Gilberg testified that, prior to Plonka's death, there had never been any similar crane boarding accidents at the Aliquippa Works.

II.

Judge Chodes found that the failure of an employee to notify a crane operator of his intention to board a crane was a hazardous practice and was

---

7/ Judge Chodes refused to consider this testimony on the basis that it concerned a different plant. The Secretary argues that evidence of this fatality was of some relevance to this proceeding and should not have been excluded from evidence. We agree. See Bethlehem Steel Corp., 81 OSAHRC 86/A2, 9 BNA OSHC 2177, 1981 CCH OSHD ¶ 25,645 (No. 77-617, 1981) appeal docketed, No. 81-2802 (3d Cir. Oct. 30, 1981); York Heel of Maine, Inc., 81 OSAHRC 114/D14, 9 BNA OSHC 1803, 1981 CCH OSHD ¶ 25,011 (No. 78-5920, 1981). However, consideration of the Secretary's offer of proof about this incident does not affect our disposition. The occurrence of the fatality at the Pittsburgh facility must be balanced against the absence of crane boarding accidents and lack of management knowledge of crane boarding violations at the Aliquippa facility. At Aliquippa, where there were over one hundred cranes and numerous employees getting on and off cranes every day, there had been no prior crane boarding accidents similar to the incident at issue in this case. Therefore, we do not agree with the Secretary that the fatality at Pittsburgh should have provided notice to J&L of a need to change its safety program with respect to crane boarding at the Aliquippa facility.

recognized as hazardous by J&L in its crane boarding rules. However, the judge determined that J&L's employees were adequately instructed on proper crane boarding procedures, including the requirement of prior notice to the crane operator of intention to board a crane, and thus he concluded that J&L did not violate section 5(a)(1). The judge noted that all the employees who testified were aware of the hazards associated with crane boarding. While the rule requiring notice to the crane operator was occasionally disregarded, Judge Chodes found that such instances were not brought to the attention of any level of J&L's supervisory structure. The judge thus concluded that J&L with the exercise of reasonable diligence could not have known of breaches of its safety rules. Additionally, the judge determined that the accident resulting in Plonka's death "would not have occurred but for the action of two employees who had full knowledge that what they did was contrary to their own appreciation of the risks involved and in direct violation of the respondent's safety rules."

The judge determined that a specific program for monitoring employee adherence to crane boarding rules was not necessary as of the date of the accident since all J&L employees who worked around cranes were familiar with the rules and since no violations of these rules had come to the attention of supervisors. Additionally, the judge concluded that failure to implement a monitoring program was not shown to be a recognized hazard. The judge also noted that, while J&L disciplined employees who violated safety rules, no such disciplinary action had been taken with respect to crane boarding rules since no violations of those rules were known by J&L's supervisory personnel. Finally, the judge found that J&L's failure to conduct a job safety analysis study of crane No. 7 was not a recognized hazard.

III.

The Secretary contends that J&L failed to implement three feasible precautions that would have materially reduced the likelihood that J&L's employees would improperly board cranes, and that because it did not implement these three precautions, J&L violated section 5(a)(1) by failing to free its worksite of recognized hazards.[8/] The Secretary maintains that J&L's safety program was deficient in that J&L should have distributed copies of safety rules to all employees, instituted a program of formal instruction or discussion of crane boarding rules, and systematically monitored employee compliance with crane boarding rules.

In order to establish a section 5(a)(1) violation, the Secretary must prove: (1) the employer failed to render its workplace free of a hazard, (2) the hazard was recognized either by the cited employer or generally within the employer's industry, (3) the hazard was causing or was likely to cause death or serious physical harm, and (4) there was a feasible means by which the employer could have eliminated or materially reduced the hazard. Baroid Division of NL Industries, Inc. v. OSHRC, 660 F.2d 439 (10th Cir. 1981); St. Joe Mineral Corp. v. OSHRC, 647 F.2d 840 (9th Cir. 1981); National Realty & Construction Co. v. OSHRC, 489 F.2d 1257 (D.C. Cir. 1973); Whirlpool Corp., 79 OSAHRC 32/A14, 7 BNA OSHC 1356, 1979 CCH OSHD ¶ 23,552 (No. 9224, 1979), rev'd on other grounds, 645 F.2d 1096 (D.C. Cir. 1981).

---

8/ The Secretary argues that the judge also erred in requiring proof of industry recognition of feasible means of abating a hazard. In the Secretary's view, the relevant standard is whether such precautions are feasible, not whether they are recognized by the industry.

An employer's duty under section 5(a)(1) is to free its workplace — to the extent feasible — of recognized hazards that are likely to cause death or serious injury. When elimination of a particular hazard requires employees to follow certain procedures, the employer must take the steps necessary to assure that employees in fact follow those procedures. General Dynamics Corp., Quincy Shipbuilding Division v. OSHRC, 599 F.2d 453, 458 (1st Cir. 1979); National Realty & Construction Co., supra. An employer is not, however, a guarantor of its employees' safety and cannot be expected to guard against conduct that is so idiosyncratic that a reasonable safety program would not guard against it. National Realty & Construction Co., supra. An employer is not in violation of section 5(a)(1) if it has established workrules designed to prevent the violation, has adequately communicated workrules to its employees, has taken steps to discover violations of the rules, and has effectively enforced the rule in the event of infractions. See Mercer Well Service, Inc., 77 OSAHRC 178/C6, 5 BNA OSHC 1893, 1977-1978 CCH OSHD ¶ 22,210 (No. 76-2337, 1977).[9/]

In this case, J&L was cited for failure to instruct its employees about hazards associated with crane boarding and for failure to implement a safety program that would compel employees to follow safe crane boarding procedures. The hazards associated with crane boarding are not in dispute, and the Secretary does not contend that J&L's crane boarding rules and procedures

---

9/ Since the Secretary failed in this case to demonstrate that J&L had not taken adequate measures to implement its safety rules, Chairman Rowland does not find it necessary to consider at this time whether an employer may properly be required to enforce workrules which have been communicated to employees. For a discussion of the question whether an employer should be required to do anything more than give instructions to employees regarding proper safety procedures, see General Electric Co. v. OSHRC, 540 F.2d 67, 69 (2d Cir. 1976); Borton, Inc., 82 OSAHRC _____, 10 BNA OSHC 1462, 1982 CCH OSHD ¶ 25,983 (No. 77-2115, 1982) (dissenting opinion).

were themselves inadequate. Further, the evidence establishes that J&L's crane boarding rules were sufficient, if followed by employees, to protect against crane boarding hazards.

The Secretary, however, argues that J&L's crane boarding rules were not sufficiently communicated to employees because copies of written rules were not distributed to all employees and because formal instructions or discussion of crane boarding rules was infrequent or, according to some J&L employees, nonexistent. The Secretary maintains that such measures would assure that all employees knew the crane boarding rules, eliminate employee confusion about the application of such rules, and underscore the importance of complying with the rules.

We disagree. The Secretary's arguments overemphasize the formal aspects of J&L's safety program and fail to give proper significance to its substance. See Texland Drilling Corp., 80 OSAHRC 106/C13, 9 BNA OSHC 1023, 1980 CCH OSHD ¶ 24,954 (No. 76-5307, 1980). Six J&L employees who worked on overhead cranes testified at the hearing, and each of these employees was familiar with the basic elements of J&L's crane boarding rules, i.e., that employees boarding cranes were to notify the operator before boarding and that employees if possible were to board cranes from crane boarding platforms.[10/] The employees also showed appreciation of the hazards associated with crane boarding. Further, testimony by several employees that reprimands or discipline would result if crane boarding

---

10/ The Secretary takes exception to the judge's finding that Plonka knew proper crane boarding procedures, contending that Churney's testimony that Plonka knew the rules was "incompetent." However, Churney had not only worked with Plonka for a number of years but had been trained as a motor inspector by Plonka. In Churney's opinion, based on his experience, Plonka was very safety conscious. Thus Churney's statement that Plonka was familiar with crane boarding rules is not only admissible, but credible. In any event, our disposition here is not affected by whether it was shown that Plonka knew the crane boarding rules, since knowledge of the rules was exhibited by the other employees who testified.

violations were detected demonstrates the employees' understanding that compliance with crane boarding safety rules was viewed as important by management.

There is no evidence that violations of J&L's crane boarding rules occurred inadvertently as a result of confusion about the meaning of the rules. Rather, the violations of the rules that were discussed in the testimony were committed by employees who knew they were violating the rules but were taking chances for reasons of convenience.[11/] Therefore, we conclude that additional distribution of crane boarding rules and formal discussion of such rules would not have significantly improved employee safety awareness of crane boarding hazards, employee understanding of proper crane boarding procedures, or employee compliance with these procedures. See Champlin Petroleum Co. v. OSHRC, 593 F.2d 637 (5th Cir. 1979).

J&L did not have a formal program to monitor employee compliance with its crane boarding procedures. However, two supervisors, on the average, were present in the stripper yard, and J&L as part of its general safety program periodically

---

11/ The Secretary contends that there was confusion even among J&L's supervisory employees about whether motor inspectors needed to obtain prior authorization from their supervisors each time they walked on the crane runways and about under what circumstances it was proper for employees to board cranes from the crane runways. However, the only employees who did not routinely obtain supervisory permission to walk on the runways were motor inspectors. The mill superintendent testified that it was not necessary for motor inspectors to obtain permission each time they walked on the runways because motor inspectors are authorized to perform all necessary repairs to cranes. Although both Gilberg, the safety administrator, and foreman D'Antonio testified that Plonka and Churney were not permitted under J&L's safety rules to go onto the crane runway in this instance, their opinion was based on the view that the crane was operative and thus could have been brought to the boarding station. Accordingly, the witnesses' testimony is not inconsistent as the Secretary contends. Similarly, with respect to the boarding of cranes from runways, the evidence shows that all such boardings that occurred at J&L's facility were the result of necessity or of a deliberate violation of J&L's safety rules. Therefore, the evidence does not establish that J&L's employees were confused about when they should board cranes from runways.

monitored employee safety compliance. The Secretary argues that J&L's monitoring of employee crane boarding was inadequate and that J&L should have increased its supervision or directed its supervisors to increase their commitment to safety functions.

There is no evidence, however, that J&L should have perceived a need for additional monitoring of crane boarding or that such an effort would have led to the discovery of crane boarding violations. As the judge noted, prior to the fatality no J&L supervisor was aware of employee violations of its crane boarding rules. J&L's employees did not report crane boarding violations to management because they did not want to get their coworkers "in trouble." Additionally, it was difficult for supervisors to spot crane boarding violations if they were not reported, apparently because an employee's failure to notify a crane operator before boarding his crane could not be readily detected from observation and because it was permissible for employees to walk on the crane runways under some circumstances. Moreover, employees engaged in crane boarding would be standing on runways or boarding platforms above the large, busy floor of the stripping yard, thus making observation of them more difficult. In addition, the employees involved in crane boarding here were motor inspectors, the most senior and experienced employees in J&L's entire maintenance department. It was reasonable for J&L to expect that close monitoring of such experienced employees would not be necessary. Therefore, we conclude that under the circumstances of this case J&L's monitoring of employee crane boarding was not shown to be inadequate.

We therefore conclude that J&L did not violate section 5(a)(1) of the Act since the Secretary failed to show what further measures J&L could have taken to render its worksite free of the cited hazard. Accordingly, the judge's

decision vacating the citation and proposed penalty is affirmed.

SO ORDERED.

FOR THE COMMISSION

Ray H. Darling, Jr.

Ray H. Darling, Jr.
Executive Secretary

DATED: JUN 25 1982

J+L
76-2636

COTTINE, Commissioner, dissenting:

In their opinion my colleagues erroneously conclude that the Respondent could not have discovered the continuing, pervasive violations of its safety rule.

I

As the lead opinion states, "J & L admitted that it was a recognized hazard for an employee to board a crane without notifying the crane operator." J & L attempted to counteract the hazards associated with crane boarding by implementing workrules requiring employees to notify the crane operator before boarding and to board cranes from designated platforms unless repairs were to be performed on cranes in areas inaccessible from boarding platforms. Even in this circumstance, notification of the crane operator was required by J & L.

My colleagues recognize that violations of the crane boarding workrule were commonplace. However, they fail to focus on the routine pattern of workrule violations. The lead opinion accurately indicates that there were more than 100 cranes at the Aliquippa worksite and, "numerous employees getting on and off cranes every day . . . ." Lead opinion at n. 7. In its brief on review, J & L refers to the number of electrical overhead cranes at Aliquippa -- "over one hundred, at least." It also makes reference to the usual, everyday practice of boarding the cranes -- "the hundreds of people who have gotten on and off cranes day in and day out for years at this plant. . . ."

My colleagues further cite the testimony of several employees who stated that they knowingly violated the rule by boarding cranes without

notifying the operators. The lead opinion also accurately states that two crane operators, Kozlina and Bielorucki, testified that violations of crane boarding rules occurred about 10% of the time. None of this evidence is rebutted. Thus, the record evidence reveals that 10% of the hundreds of employees who board more than 100 cranes each day do so in a manner admitted by the Respondent to constitute a recognized hazard!

II

Incredibly, my colleagues conclude that a program to monitor for employee compliance was not required because J & L did not know about employee non-compliance. Of course, it did not know of employee non-compliance because it failed to adequately monitor compliance with the workrule.

The lead opinion attempts to support its conclusion that monitoring was not required by stating,

> As the judge noted, prior to the fatality no J & L supervisor was aware of employee violations of its crane boarding rules. J & L's employees did not report crane boarding violations to management because they did not want to get their coworkers "in trouble."

Yet, the supervisors' ignorance of workrule violations was a direct result of their failure to monitor. Furthermore, the need for management monitoring is reinforced by the understandable failure of employees to report one another's workrule violations.

The lead opinion continues:

> Additionally, it was difficult for supervisors to spot crane boarding violations if they were not reported, <u>apparently</u> because an employee's failure to notify a crane operator before boarding his crane could not be readily detected from observation and because it was permissible for employees to walk on the crane runways under some circumstances. Moreover, employees engaged in crane boarding would be standing on runways or boarding platforms above the large, busy floor of the stripping yard, thus making observation of them more difficult. (emphasis added.)

Encountering "difficulty" in spotting a violation does not negate the obligation to do so. As the lead opinion correctly states, "An employer is not in violation of section 5(a)(1) if among other things it . . . has taken steps to discover violations of [workrules]. . . . See Mercer Well Service, Inc., 77 OSAHRC 178/C6, 5 BNA OSHC 1893, 1977-78 CCH OSHD ¶22,210 (No. 76-2337, 1977)." Moreover, as my colleagues amply demonstrate through their equivocation ("apparently"), the record does not indicate why the workrule is even "difficult" to enforce.[1/]

The lead opinion's unsuccessful attempt to support its result continues:

> In addition, the employees involved in crane boarding here were motor inspectors, the most senior and experienced employees in J & L's entire maintenance department. It was reasonable for J & L to expect that close monitoring of such experienced employees would not be necessary.

My colleagues ignore Commission precedent that would lead to a contrary conclusion. Well-settled Commission and courts of appeals precedent holds that an employer has responsibility for providing a safe and healthful workplace and delegation of that responsibility to employees is inconsistent with the purposes and policies of the Act. PBR, Inc., 643 F.2d 890, 895 (1st Cir. 1981); Empire Detroit Steel Division v. OSHRC 579 F.2d 378, 385 (6th Cir. 1978); Atlantic & Gulf Stevedores, Inc. et al v. OSHRC, 534 F.2d 541, 553, 554 (3rd Cir. 1976). As the Commission has stated, "The fact that. . .employees in positions of responsibility thought that deviation from [a safety workrule] was acceptable conduct is persuasive evidence that a requirement to comply with the rule was

---

1/ Nor does the record reveal any evidence that it is difficult to observe activity above the work level because that work level is large and busy.

not effectively. . .enforced by the company." Western Massachusetts Electric Co., 81 OSAHRC 63/B13, 9 BNA OSHC 1940, 1945, 1981 CCH OSHD ¶25,470 at p. 31,766 (No. 76-1174, 1981). See also Ted Wilkerson, Inc., 81 OSAHRC 70/D8, 9 BNA OSHC 2012, 2016, 1981 CCH OSHD ¶25,551 at p 31,856 (No. 13390, 1981) (violation occurring in presence of leadman results in rejection of defense to 5(a)(1) violation based on workrule because leadman could have known of violation); United Geophysical Corp., 81 OSAHRC 77/D6, 9 BNA OSHC 2117, 2123, 1981 CCH OSHD ¶25,579 at p. 31,907 (No. 78-6265, 1981), appeal filed, No. 81-4342 (5th Cir. 1981) (lax implementation of safety policy evidenced by supervisor breach). In addition, the Commission has consistently noted that,

> [E]xperienced as well as inexperienced workers may be subject to accidents resulting from inadequate operating procedures, poor training, and employee inadvertence (citations omitted).

Cornell & Company, Inc., 77 OSAHRC 164/F5, 5 BNA OSHC 1736, 1739, 1977-78 CCH OSHD ¶22,095 at p. 26,608 (No. 8721, 1977). See also Hughes Brothers, Inc., 78 OSAHRC 65/A2, 6 BNA OSHC 1830, 1978 CCH OSHD ¶22,909 (No. 12523, 1978) and cases cited. Though the degree of supervision may vary, there is a minimum requirement to protect the health and safety of all employees regardless of their experience.

III

The lead opinion correctly states that,

> When elimination of a particular hazard requires employees to follow certain procedures, the employer must take the steps necessary to assure that employees in fact follow those procedures. General Dynamics Corp., Quincy Shipbuilding Div. v. OSHRC, 599 F.2d 453, 458 (1st Cir. 1979); National Realty & Construction, supra.[2/]

---

2/ It is not clear whether Chairman Rowland adheres to this view because he "does not find it necessary to consider at this time whether an employer may properly be required to enforce workrules. . . ." Lead op. at n. 9. He avoids the issue by concluding that the Secretary has failed to demonstrate that J & L failed to implement its safety rules.

Under section 5(a)(1) the employer has the duty to take all feasible steps to eliminate hazardous conduct from its workplace. General Dynamics Corp., Quincy Shipbuilding Div. v. OSHRC, supra; National Realty & Construction Co. v. OSHRC, 489 F.2d 1257, 1266-67 (D.C. Cir. 1973). Beaird-Poulan Div., Emerson Electric Co., OSAHRC , 7 BNA OSHC 1225, 1230, 1979 CCH OSHD ¶23,493 at p. 28,460-6 (No. 12600, 1979); See Brennan v. Butler Lime and Cement Co., 520 F.2d 1011, 1017 (7th Cir. 1975).

As the Commission recently stated, "The nature of an employer's duty to prevent hazardous conduct is the same whether the case arises under section 5(a)(1) or 5(a)(2). The elements of an effective safety program do not depend on the action [sic] of the Act that is allegedly violated." Western Massachusetts Electric Co., supra, 9 BNA OSHC at 1944-45, 1981 CCH OSHD at p. 31,765. The Commission emphasized that, under section 5(a)(2), when employee conduct has resulted in noncompliance with a standard, it is the employer's burden to plead and prove as an affirmative defense that it could not prevent the employee's misconduct. Under section 5(a)(1) the burden is on the Secretary to prove that the cited employer breached its duty to render the workplace free of a hazard and an employer may rebut on the basis that it took all necessary precautions to prevent the occurrence of the violation. 9 BNA OSHC at 1945, 1981 CCH OSHD at p. 31,765-66. As stated by the U.S. Court of Appeals for the 1st Circuit,

> [w]hen the employer's defense is that the hazard occurred as a result of unauthorized and idiosyncratic behavior by its employees, the issue of an employer's training and supervision of its employees automatically arises as part of the employer's showing that it took all feasible steps to avoid the occurrence of the hazard.

General Dynamics, Corp., Quincy Shipbuilding Div. v. OSHRC, 599 F.2d at 459.

IV

In this case the unrebutted evidence that 10% of the hundreds of boardings that occur daily are in violation of J & L's safety rule establishes that the worksite has not been freed of the cited hazard.[3/] The Secretary has thus sustained his burden of proof. J & L has totally failed to rebut this prima facie case. "There is no evidence that Respondent made any efforts to ascertain whether its safety rules were followed. Effective safety enforcement requires a diligent effort to discover and discourage violations of safety rules by employees." Paul Betty dba Betty Brothers, 81 OSAHRC 18/B11, 9 BNA 1379, 1383, 1981 CCH OSHD ¶25,219 at pp. 31,151-52 (No. 76-4271, 1981). Workrules must be enforced through supervision adequate to detect failures to comply with the rules. United Geophysical Corp., supra; Floyd S. Pike Electrical Contractor, Inc., 78 OSAHRC 50/E1, 6 BNA OSHC 1675, 1978 CCH OSHD ¶22,805 (No. 3069, 1978). J & L's failure in this regard is obvious. The violation should be affirmed because J & L failed to rebut the Secretary's evidence establishing a recognized hazard that could have been obviated by implementation of an adequately enforced workrule and because the hazard was likely to, and in fact did, result in death or serious physical injury to an employee.

---

3/ In Marson Corp., No. 78-3491 (May 27, 1982), Chairman Rowland recently dissented to the majority's affirmance of a machine guarding violation. He stated that the employer's safety rule was violated "in only a fraction of one percent of the total production operations " and explained that, "Because of the extreme infrequency of the circumstances under which a violation may occur, it is patently unreasonable to expect Marson to predict and prevent every instance of its occurrence." In this case, the workrule violations were not extremely infrequent; they occurred in 10% of the hundreds of daily boardings.

| SECRETARY OF LABOR | : | |
| Complainant | : | DECISION AND ORDER |
| v. | : | OSHRC Docket No. 76-2636 |
| JONES & LAUGHLIN STEEL CORPORATION | : | |
| Respondent | : | |

APPEARANCES:

Matthew J. Rieder, Esq., of Philadelphia, Pennsylvania, for the Secretary of Labor

Daniel R. Minnick, Esq., and Robert C. Gombar, Esq., of Pittsburgh, Pennsylvania, for the Respondent

Chodes, Judge

STATEMENT OF THE CASE

This is a proceeding pursuant to section 10 of the Occupational Safety and Health Act of 1970 (29 U.S.C. §651 et seq., hereinafter referred to as the Act), in which the respondent is contesting Citation No. 3[1/] issued by the complainant against the respondent under the authority vested by section 9(a) of the Act. The citation which was issued on May 20, 1976, alleged that on the basis of an inspection made on May 6, 10 and 11, 1976, of a place of employment

1/ Respondent was also issued Citation No. 2 which contained items 1a and 1b. Item 1a was deleted and item 1b was added to Citation No. 1. Citation No. 1 was not contested and became the final order of the Commission under the provisions of section 10(a) of the Act (29 U.S.C. §659(a)).

located at the Aliquippa Works, Aliquippa, Pennsylvania, the respondent violated section 5(a)(1) of the Act (29 U.S.C. §654(a)(1)), the so-called general duty clause, by failing to furnish its employees employment and a place of employment which was free from recognized hazards that were causing or were likely to cause death or serious physical harm to employees. A penalty of $800 was proposed for the alleged violation.

After the respondent contested the enforcement action and a complaint and answer had been filed by the parties, the case was heard in Pittsburgh, Pennsylvania on March 8 and 9, 1977.

STIPULATIONS (T-6-8, 54)

1. The legal name of the respondent is Jones & Laughlin Steel Corporation and the state of incorporation is Pennsylvania.

2. In May 1976 the respondent was engaged in the manufacturing of steel and steel products by manufacturing them in Pennsylvania and shipping them to locations outside of Pennsylvania. Therefore, respondent is engaged in interstate commerce.

3. Respondent is ranked seventh nationally as a steel corporation in terms of sales and shipments.

4. In 1975 the net income of the respondent was approximately $30.6 million, a 1.8 percent return on sales. Shipments slightly exceeded four million tons of steel.

5. The net worth of respondent as of December 31, 1975, was $839,802,000.

6. On May 4, 1976, the date of the alleged violation, respondent was the employer of John Plonka, whose injury and subsequent death was the basis for the investigation which resulted in this Citation.

7. Mr. Plonka was employed at the Aliquippa Works of the respondent. The respondent is responsible for the control of equipment located at the work site.

8. At the time of the incident, the respondent's work force at Aliquippa Works was approximately 11,000 people, a figure which varies because it includes people who are on vacation, not working because of illness, on leave of absence, or other reasons.

9. The respondent posted the Citation and Notice of Contest and Notice of Hearing on the bulletin board at the north end of the stripper yard, steel works department, Aliquippa Works. This is a common bulletin board in an area where notices are normally posted.

THE ACCIDENT

On May 4, 1976, John Plonka and Blaze F. Churney, motor inspectors, were called over respondent's public address system by Fred D'Antonia, foreman, to change the brake shoes on the ram of Crane No. 7, located in the stripper yard of respondent's Aliquippa Works. They proceeded to the crane boarding station where they waited for the brakes, which weighed 40 pounds each, to be brought to them from a building in another location. The brakes were a long time in coming so they climbed up steps to the crane runway which was about 30 feet above the crane operator's cab and about 60 feet above the ground and watched while the crane cleaned the yard with the magnet. By the time the crane finished the cleaning-up job, the brakes arrived, but instead of the crane coming back south, which would be the normal procedure, the crane stayed at the north end (T-70-77).

Because the crane wasn't coming to the south end, Mr. Plonka and Mr. Churney walked on the runway towards the crane where there were eight buggies of molds with hot steel waiting to be stripped. Fred D'Antonio, foreman, saw the two inspectors on the runway about 40 to 50 feet above (his estimate) and told them to "hold up." Mr. D'Antonio called the crane operator, Wasso Kozlina, Jr., to come out of the crane cab and told him to ask the "steel chaser" to let him (D'Antonio) know whether to strip the heat (steel) or give the crane over to the inspectors to do the brake job. Mr. Wasso contacted the steel chaser and told Mr. D'Antonio the heat was to be stripped before the brakes were replaced. Mr. D'Antonio informed Mr. Plonka and Mr. Churney that the crane would strip the heat first and then they could have the crane. He told the inspectors to go to the south end and wait for the crane. Mr. Churney testified that he did not recall being told by Mr. D'Antonio where to wait until the crane became available (T-78, 79, 81, 369, 370).

Mr. Plonka and Mr. Churney watched the stripping operation for awhile and then decided to go on the crane with the intention of telling the crane operator to stop the crane. Mr. Churney watched the crane when it was over a mold and, "knowing" that it would not move, he boarded the crane. As soon as Mr. Churney reached the crane trolley, he tried to get in touch with the crane operator, Mr. Wasso, through the speaker system, but was unable to do so because the system was broken down. He called to Mr. Wasso to stop the crane and let Mr. Plonka on, but got no response. Mr. Wasso continued to operate the crane, going from mold to mold stripping the steel. Mr. Plonka apparently thought that

the crane had stopped and started up the crane and was pinned between the guardrail and column at the point marked "H" on Exhibit C-1. Mr. Churney tried to have the crane stopped and then turned the power off at the main disconnect. Mr. Plonka died of the injuries he sustained. Mr. Churney testified that the light was green when he and Mr. Plonka boarded the crane and he knew he was violating the crane boarding rules when he did not notify the crane operator that he and Mr. Plonka wanted to board the crane, but he took a calculated risk (T-82, 83, 92-94, 110).

## THE CITATION

The fatality resulted in an OSHA inspection and the issuance of the citation which is the subject of this proceeding. The citation, as amended, alleged the following:

> The employer did not furnish to each of his employees employment and a place of employment which was free from recognized hazards that were causing or were likely to cause death or serious physical harm to his employees in that:
>
> On May 4, 1976, motor inspectors in the following location, were not adequately instructed on the proper crane boarding procedures and/or hazards associated with improper crane boarding, and there was not on that date, nor prior thereto, a safety program with systematically enforced work rules which would effectively compel the motor inspectors and other employees exposed to hazards associated with the boarding of cranes to follow safety procedures directed to those hazards.

The citation poses the question whether respondent's safety program adequately instructed employees on the proper crane boarding procedures and systematically enforced work rules which would compel employees to follow instructions.

## RESPONDENT'S SAFETY PROGRAM

Respondent has an overall safety program which is contained in Exhibit R-2, a 40-page manual entitled "Manual Covering the Administration of the Basic Accident Prevention Program." A booklet (Exhibit R-4) entitled "General Safety Guides for All Employees" is distributed to new employees when initially hired and at the same time they are indoctrinated safety-wise with a slide program (T-285). Chapter X relates to Overhead Traveling Cranes and advises employees connected with crane work to obtain a copy of the Safety Rules for Electric Overhead Cranes (Exhibit C-3) referred to below.

Respondent has a "Keep Your Buddy Safe" program in its Alliquippa Works. This includes safety seminars attended by persons selected by the union and management. "Keep Your Buddy Safe" slogans are posted around the plant. Monthly meetings are held in each department at which subjects for discussion are submitted in advance. Also, awards are made to divisions with the best housekeeping. Posters received from the National Safety Council on various safety subjects are posted about twice a month. A field safety inspector whose duties are to attend safety meetings, look for unsafe practices and review accident reports is assigned to the Steel Works Department. He works with the supervisors and reports to Garold Gilberg, respondent's safety director (T-289-293).

Respondent also has a joint labor-management safety and health committee which meets every month, composed of four management and four hourly or union people present. A job analysis program requires the general foreman of each plant division (there are about 120)

to make a job safety analysis each month. The general foreman gets his foremen and frequently also employees together for their input. A job safety analysis of Crane No. 7 was not done because it was relatively new, having been installed in 1975 (T-288-290, 298, 374).

Respondent's safety rules or procedures relating to cranes are contained in a booklet (Exhibit R-3) entitled "Safety Rules for Electric Overhead Traveling Cranes or Gantry Crane Operators, Crane Directors, Hook-up Men, Repairmen (Cab Operated)." Instructions relating to boarding cranes are as follows:

INSTRUCTIONS FOR ALL PERSONS
GETTING ON AND OFF CRANES

1. Employes shall use only the regular prescribed stairways or ladders and crane approaches when getting on or off cranes.

2. Employes shall at no time walk crane runways unless authorized to do so by the person in charge.

3. No one shall get on or off moving cranes.

4. Authorized employe, before getting on a crane which is manned, shall first notify the crane operator of his intention. The crane operator shall then place the main electric switch in "off" position with red indicator light "on" and assume a position outside of the crane cab where he can be seen by the employe wishing to board the crane. After the employe has arrived in the crane cab, the crane may be put into operation.

5. When getting off a crane which is manned, the employe shall first notify the crane operator of his intention. The crane operator shall then place the main electric switch in "off" position with red indicator light "on" and assume a position outside the crane cab where he can see the person after he gets off the crane. The crane operator shall not put the crane into operation until he receives a signal from the person getting off the crane that he is in the clear.

6. If the red indicator light is out of order, contact shall be made with the crane operator. If the crane operator is off the crane, the Supervisor in charge will advise persons intent on getting on crane.

It is not established that all persons involved with crane operations received this booklet. Mr. Plonka was issued a booklet in 1952 (T-304), Wasso Kozlina, the crane operator, received a booklet in 1946, and Peter Koman, inspector, received a booklet 25 years ago, but Mr. Churney, Donald Mancini, millwright helper, and Wallace Ermi, motor inspector, testified that they were not furnished the booklet (T-16, 103, 121, 138, 171). However, the booklet is distributed routinely to employees and supervisors in the various units where the rules apply and are available to employees on request (T-282). The booklet is referred to by its title on the "Notice to Crane Operators" (Exhibit R-1) which is posted in all overhead crane cabs, in the Steel Works Department and in the Maintenance Office which is frequented by motor inspectors and millwrights . The booklet is also discussed with supervisors at regularly scheduled meetings (T-286-288).

All persons authorized to work on cranes were familiar with the proper boarding procedures. Employees confirmed their knowledge of the crucial crane boarding points, including use of regular prescribed stairways or ladders when possible in getting on and off cranes, notification of the crane operator before boarding a crane, and not to get on a crane when the green light is on indicating that the crane is operative. For the most part the employees' knowledge of the safety rules was acquired on the job by observation of and discussion with other employees (T-21, 22, 38, 39, 57, 58, 101).

There is evidence that at times respondent's employees did violate the crane boarding safety rules. Mr. Churney testified that sometimes, under pressure to get the job done, he would take a shortcut to get

on a crane (T-116). Mr. Kozlina, the crane operator, testified that employees have boarded his crane without notifying him and have boarded the crane from the runway when the crane was not broken down (T-24, 25). Neither Mr. Churney nor Mr. Kozlina notified supervision of any infraction of the crane boarding safety rules (T-43, 119). Mr. Kozlina also testified that salaried (supervisory) employees also boarded the crane without notifying him, but that he knew they were coming on the crane. On questioning, Mr. Kozlina did not furnish the supervisor's scope of authority nor identify the supervisor involved (T-23, 43, 44). Frederick S. Kelsey, Superintendent of Steel Works, testified that a violation of the crane boarding procedures was never brought to his attention (T-337). Mr. D'Antonio, foreman, never saw any supervisory person get on a crane without notifying the crane operator (T-366) and he never saw an employee board a crane from a runway when the crane could be moved (T-379).

## DISCUSSION

To prevail in this proceeding, complainant must establish that respondent did not furnish its employees with employment and a place of employment which was free from recognized hazards. The failure of an employee to notify a crane operator of his intention to board a crane is a recognized hazard in industry (T-198) and this is also recognized by the respondent in its safety rules for electric overhead cranes (Exhibit R-3). Notifying the crane operator of intention to board the crane before doing so is the most important safety factor involved in crane boarding (T-200, 221). Consequently, if respondent did not instruct its employees to observe this safety rule and, if necessary, take disciplinary action to enforce the rule, a finding could be made that respondent did not furnish its employees a place of employment that was free from recognized hazards. A violation of the general duty clause

occurs whenever an employer fails to take reasonable precautionary steps to protect his employees from reasonably forseeable "recognized hazards" that are causing or are likely to cause death or serious physical injury. Brennan v. OSHRC and Vy Lactos Laboratories, 494 F.2d 460, (8th Cir., 1974).

However, the preponderence of the evidence establishes that respondent's employees were adequately instructed on the proper crane boarding procedures including prior notice to the crane operator of intention to board the crane, and the testimony adduced evinced an awareness by all witnesses of the hazards associated with crane boarding. While there was occasionaly disregard of the rule regarding notice to the operator, there is no substantial evidence that these instances were brought to the attention of the respondent at any level of its supervisory structure or that these breaches of safety rules could have been known by the respondent with the exercise of reasonable diligence. The accident, which resulted in the death of an employee, would not have occurred but for the action of two employees who had full knowledge that what they did was contrary to their own appreciation of the risks involved and in direct violation of the respondent's safety rules.

Louis O'Matz, the complainant's Compliance Officer, who conducted the investigation in this case, testified that a program for safe crane boarding procedures should include furnishing information to employees of accidents as they occur with the view to preventing future accidents, job safety analysis studies with employee participation, and enforcement of safety rules by taking disciplinary actions against employees, including supervisors, who do not obey safety rules (T-207-209).

With respect to discussing accidents with employees, it is considered a fair inference that such matters, which are generally well known when they occur, are discussed at regularly scheduled safety

meetings. Exhibit 5, which is a "Fatal Accident Report," indicates that following the occurrence of an accident, employees are informed and methods of avoiding similar occurrences are suggested. As for job safety analysis studies, such studies are conducted by respondent as part of its general safety program. While no studies were made in connection with the operation of Crane No. 7, which had been in operation a relatively short time, it would be straining to conclude that this failure constituted a recognized hazard related to safe boarding procedures. As for disciplining employees who disregard safety rules, respondent, as part of its general safety policy, did discipline employees for violation of safety rules but, admittedly, no disciplinary action was ever taken for violation of crane boarding rules for the very good reason that no violation was ever brought to the attention of respondent's supervisory personnel.

While there was no specific program for monitoring adherence to the crane boarding rules, the evidence does not establish that, as of the date of the accident, there was a need for such a program, given the fact that all employees engaged in working around cranes were familiar with the rules and no instance of a violation of the rules came to the attention of supervisors. Even if it is assumed that an affirmative program checking on employee compliance with the safety rules would be desirable, there is no showing that failure to implement such a program was recognized as a hazard by the respondent or by industry generally. Absent proof of a recognized hazard, a citation under the general duty clause cannot be sustained.

On the basis of the record in this case, it is concluded that the complainant has not established by a preponderence of the evidence that the respondent failed to furnish its employees employment and a place

of employment which was free from recognized hazards that were likely to cause death or serious physical harm.

## CONCLUSIONS OF LAW

The citation, notification of proposed penalty, notice of contest, pleadings, stipulations, the testimony and exhibits adduced to the hearing, and the representations of the parties, support the following conclusions:

1. The respondent at all times material hereto was engaged in business affecting commerce within the meaning of section 3(5) of the Occupational Safety and Health Act of 1970.

2. The respondent at all times material hereto was subject to the requirements of the Occupational Safety and Health Act and the standards promulgated thereunder, and the Commission has jurisdiction of the parties and of the subject matter herein.

3. Respondent did not violate section 5(a)(1) of the Act as alleged in Citation No. 3 issued on May 20, 1976.

## ORDER

Upon the basis of the foregoing and upon the entire record it is

ORDERED that Citation No. 3, issued on May 20, 1976, and the proposed penalty are vacated.

|---|---|
| SECRETARY OF LABOR,<br>Complainant,<br>v.<br>PRESTRESSED SYSTEMS, INC.,<br>Respondent. | OSHRC Docket No. 76-4278 |

DECISION

Before: ROWLAND, Chairman; CLEARY AND COTTINE, Commissioners.

BY THE COMMISSION:

A decision of Administrative Law Judge James D. Burroughs has been directed for review under 29 U.S.C. § 661(i), section 12(j) of the Occupational Safety and Health Act of 1970, 29 U.S.C. §§ 651-678. Relying on Frank Briscoe Co., 76 OSAHRC 129/A2, 4 BNA OSHC 1729, 1976-77 CCH OSHD ¶ 21,162 (No. 7792, 1976), Judge Burroughs found that a violation had not been proved because the use of safety belts had not been shown to be feasible. After the judge's decision was issued, the Commission overruled Frank Briscoe in S & H Riggers & Erectors, Inc., 79 OSAHRC 23/A2, 7 BNA OSHC 1260, 1979 CCH OSHD ¶ 23,480 (No. 15855, 1979), rev'd, 659 F.2d 1273 (5th Cir. 1981). Accordingly, this case is remanded for further proceedings in light of that case.

SO ORDERED.

FOR THE COMMISSION

Ray H. Darling, Jr.

Ray H. Darling, Jr.
Executive Secretary

DATED: JUN 29 1982

ROWLAND, Chairman, dissenting:

Judge Burroughs' decision was correct and should be affirmed for the reasons he gave. I would adhere to the test set forth in Frank Briscoe and require the Secretary of Labor to prove the feasibility and likely utility of the personal protective equipment that should have been used.

Since section 1926.28(a) does not prescribe objective criteria for determining the employer's duty, the Secretary must prove that the use of safety belts was feasible. See H.E. Wiese, Inc., 82 OSAHRC _____, 10 BNA OSHC 1499, 1511 n.15, 1982 CCH OSHD ¶ 25,985, p. 32,619 n.15 (No. 78-204, 1982)(Chairman Rowland, dissenting in part); and Bethlehem Steel Corp., 82 OSAHRC _____, 10 BNA OSHC 1607, 1611 n.4, 1982 CCH OSHD ¶ 26,043, p. 32,704 n.4 (No. 77-1545, 1982)(Chairman Rowland, concurring)(section 1910.132(a)). I would vacate the citation because the record does not show that safety belts were feasible. 1/

---

1/ I express no view here on the correctness of the Commission's reasonable person test in S & H Riggers & Erectors, Inc., 79 OSAHRC 23/A2, 7 BNA OSHC 1260, 1979 CCH OSHD ¶ 23,480 (No. 15855, 1979), rev'd, 659 F.2d 1273 (5th Cir. 1981).

## DECISION AND ORDER

APPEARANCES: Annette Ball, Esquire, Office of the Solicitor, U. S. Department of Labor, Atlanta, Georgia, on behalf of complainant.

Clair W. Langmaid, Esquire, Atlanta, Georgia, on behalf of respondent.

## STATEMENT OF CASE

Burroughs, Judge: This is a consolidated proceeding initiated pursuant to section 10(c) of the Occupational Safety and Health Act of 1970, 29 U.S.C. 651 et. seq., 84 Stat. 1590 ("Act"). Respondent seeks review of item one of a non-serious citation issued to it on September 1, 1976 (Docket No. 76-4276), a serious citation issued to it on September 8, 1976 (Docket No. 76-4278) and a repeated citation issued to it on September 8, 1976 (Docket No. 76-4278).

Review is also sought of the penalties proposed for the alleged violations.

Respondent is a corporation with a place of business at 5601 N.W. 72nd Avenue, Miami, Florida. It is engaged in the business of forming and prestressed concrete construction. The non-serious citation issued in docket number 76-4276 emanated from an inspection conducted on August 24, 1976, at a construction site located at 8th Street S.W. and 107th Avenue, Miami, Florida. The serious citation and repeated citation issued in docket number 76-4278 emanated from an inspection conducted on September 1, 1976, at Palm Beach Lakes Boulevard and Congress Avenue, West Palm Beach, Florida.

Item one of the non-serious citation issued to respondent on September 1, 1976 (Docket No. 76-4276) alleges that respondent violated section 5(a)(2) of the Act by failing to comply with the housekeeping standard set forth at 29 C.F.R. § 1926.25(a). The citation described the alleged violation as follows:

> "Debris was not kept cleared from the following:
>
> (a) eastern approach to the building site, 1st, 2nd and 3rd levels."

A penalty of $40 was proposed for the alleged violation.

The serious citation issued to respondent on September 8, 1976, alleges that respondent committed four separate violations of the outrigger scaffold standards set forth at 29 C.F.R. §

1926.451(g). The four alleged violations were construed in the aggregate as constituting a serious violation. The citation set forth the provisions allegedly violated and described the alleged violations as follows:

Item 1a - 29 C.F.R. § 1926.451(g)(5)

"Standard guardrails and toeboards were not installed at all open sides and ends on outrigger scaffold(s) more than 10 feet above the ground or floor:

(a) at the 5th level on the south side of the building there were no guardrails and toeboards on the outrigger scaffold."

Item 1b - 29 C.F.R. § 1926.451(g)(1)

"On outrigger scaffold(s) the inboard end of the outrigger beams, measured from the fulcrum point to anchorage point, was less than 1 1/2 times the outboard end length:

(a) at the 5th level on the south side of the building, beams supporting the scaffold platform measured six feet outboard length and only five feet from the fulcrum point to the anchorage point."

Item 1c - 29 C.F.R. § 1926.451(g)(3)

"Outrigger scaffold(s) were not designed by a registered professional engineer competent in this field, nor constructed and erected in accordance with Table L-13:

(a) scaffold planking on the outrigger scaffold at the 5th level on the south side of the building was cracked and broken 3/4 inch plywood sheets."

Item 1d - 29 C.F.R. § 1926.451(g)(4)

"On outrigger scaffold(s) the planking was not laid tight:

"(a) at the 5th level on the south side of the building there was a 7 1/2 inch gap between plywood sheets."

A penalty of $950 was proposed for the alleged violation.

The repeated citation issued to respondent on September 8, 1976, alleged a violation of the personal protective equipment standard set forth at 29 C.F.R. § 1926.28(a). The citation described the alleged violation as follows:

"The employer did not require the wearing of appropriate personal protective equipment in all operations where there was an exposure to hazardous conditions:

(a) employees installing forming on the 2nd level of the parking building were walking along 8 inch wide concrete beams, carrying several 4x4 inch form braces, while exposed to a fall hazard of 10 feet, were not required to wear safety belts securely attached to lifelines until form decking had been placed to protect them from the fall hazard."

A penalty of $160 was proposed for the alleged violation.

On December 2, 1976, an order was issued consolidating Docket Numbers 76-4276, 76-4277 and 76-4278 for purposes of hearing, briefs and decision. Subsequent to the hearing, complainant filed a notice of withdrawal in Docket Number 76-4277. An order was issued on February 23, 1977, severing Docket Numbers 76-4276 and 76-4278 from Docket Number 76-4277.

A hearing was held in these consolidated cases on January 11, 1977, in Fort Lauderdale, Florida. No additional parties desired to intervene in the proceeding (Tr. 4).

During the course of the hearing, counsel for respondent sought to amend the answer to raise the defense that it was impossible to comply with 29 C.F.R. § 1926.28(a). The defense had not been raised prior to the trial. The motion to amend was denied (Tr. 37-39). Respondent argues in its brief that the failure to grant the motion to amend was in error.

## JURISDICTION AND ISSUES

Respondent, at all times material to this proceeding, concedes that it was engaged in a business affecting commerce within the meaning of the Act and that the Commission has jurisdiction of the parties and of the subject matter (Paras. I, II, Complaints and Answers).

The following issues are presented to the Commission for determination:

1. Did respondent violate section 5(a)(2) of the Act by failing to comply with the following standards:
   a. 29 C.F.R. § 1926.25(a)
   b. 29 C.F.R. § 1926.451(g)(1)
   c. 29 C.F.R. § 1926.451(g)(3)
   d. 29 C.F.R. § 1926.451(g)(4)
   e. 29 C.F.R. § 1926.451(g)(5)
   f. 29 C.F.R. § 1926.28(a)
2. Were the violations of 29 C.F.R. § 1926.451(g)(1), (3), (4) and (5), if they occurred, serious within the meaning of section 17(k) of the Act?

3. Was the violation of 29 C.F.R. § 1926.28(a), if it occurred, a repeat violation within the purview of section 17(a) of the Act?

4. Did the Judge error in refusing to allow respondent's motion to raise an affirmative issue during the course of the hearing?

5. What penalties, if any, should be determined in the event any violations are determined against respondent?

FINDINGS OF FACT

The following facts are specifically determined in resolving the issues in dispute:

1. Respondent is a corporation with a place of business and doing business, among other places, at 5601 N.W. 72nd Avenue, Miami, Florida. It is engaged in the business of forming and concrete construction (Para II, Complaints and Answers; Tr. 62).

2. Respondent's annual volume of business in 1976 was $8,000,000.00. In previous years its volume of business has been higher. Most of its business has arisen in Florida (Tr. 60, 61).

3. During the course of a single year, respondent may be involved in 100 to 120 different jobs. During any given week, it has between 15 to 20 active jobs (Tr. 60, 136).

DOCKET NO. 76-4278

A. SERIOUS CITATION

4. On September 1, 1976, Compliance Officer John S. Ruggles, Jr., conducted an inspection of respondent's work site located at

Palm Beach Lakes Boulevard and Congress Avenue, West Palm Beach, Florida. A ten-story office building was under construction at the site (Para. IV, Complaint and Answer; Tr. 6, 8, 42).

5. Two outrigger scaffolds were located side by side at the fifth level on the south side of the office building under construction. The scaffolds projected out approximately six feet from the side of the building. The scaffolds had no guardrails or toeboards (Exs. 1, 3, 4; Tr. 8, 13, 75).

6. The scaffolds were some 32 to 35 feet above the ground surface. The area below was dirt with some debris scattered over the ground (Ex. 1; Tr. 9, 13).

7. Four-by-four pieces of lumber had been stacked on the scaffolds by two employees of respondent sometime prior to the inspection. The scaffolds had no guardrails or toeboards at the time the lumber was stacked. The employees wore no safety belts while stacking the lumber (Exs. 1-4; Tr. 8, 13, 43, 44).

8. Compliance Officer Ruggles observed no employees on the outrigger scaffolds at anytime during his inspection (Tr. 43).

9. The outrigger beams projecting outside the building were six feet in length. The inside end of the beams, measured from the fulcrum point to anchorage point, was five feet (Exs. 1, 4; Tr. 10, 14, 88).

10. The outrigger scaffolds were not designed by a registered professional engineer (Tr. 11).

11. The scaffolds were covered with three-quarter-inch plywood sheets. The portion on which the four-by-fours were stacked had double sheets of plywood. The area, as one entered the scaffolds from the building, was covered with one sheet of plywood. There was a gap of seven-and-one-half inches between the two scaffolds which ran essentially through the center (Exs. 1, 3; Tr. 11, 14, 89-91).

12. A corner of one of the plywood sheets that was used for single coverage was broken and moved downward with the pressure of a foot on it (Ex. 3; Tr. 15-16, 90-91).

13. The outrigger scaffolds were of a standard design utilized by respondent on other jobs. Respondent has never experienced any trouble in the use of this particular outrigger scaffold (Tr. 74).

14. Respondent's employees had been instructed to use safety belts when they went onto an outrigger scaffold. Guardrails tended to interfere with the lifting of materials from the crane onto the scaffold (Tr. 77).

DOCKET NO. 76-4278

B. REPEAT CITATION

15. A parking building under construction was located to the north and rear of the office building. Employees of respondent were laying four-by-four inch stringers on the second level to support plywood sheets to form the foundation for a cement pour for the second level of the parking garage (Tr. 18-19, 20, 42-43).

16. Two employees were observed standing on eight-inch wide prestressed concrete beams located approximately ten feet above a cement floor. They were engaged in setting the forming work by laying the stringers. They worked from their position on the prestressed concrete beams (Ex. 5; Tr. 18-19, 20).

17. The prestressed concrete beams had reinforcing rods projecting up from the center. Employees walked along the beams carrying pieces of four-by-four (Tr. 19, 23).

18. The employees wore no type of safety equipment (Ex. 5; Tr. 19).

19. The parking building was to be four levels. At the time of the inspection, employees were working on the second level (Tr. 19).

20. Subsequent to the inspection, respondent planked over the stringers to provide a safer walking and working surface (Tr. 19-20, 21-22).

21. Compliance Officer Ruggles held a closing conference with respondent's safety director, Elliott Goldstein (Tr. 34).

22. On October 7, 1975, Compliance Officer B. T. Beall, Jr., conducted an inspection of respondent's work site located at 1980 Northwest 10th Avenue, Miami, Florida (Tr. 46). As a result of the inspection, respondent was issued a serious citation alleging that it violated 29 C.F.R. § 1926.28(a) (Ex. 6; Tr. 25-26, 46). An informal conference was held with the area director concerning

the alleged violation. As a result of the conference, the violation was downgraded to a non-serious violation, and the non-serious citation issued on October 24, 1975, was not contested (Ex. 6; Tr. 25-26, 46, 55, 61-62, 64-65).

23. In addition to the non-serious citation issued to respondent on October 24, 1975, respondent has been issued citations on six other occasions as a result of inspections conducted at its work sites. None of the citations were contested (Ex. 7; Tr. 28-31).

24. On October 7, 1975, employees of respondent were in the process of setting formwork for the fourth level concrete pour of a building under construction. The top of the formwork was approximately 42 feet above ground level and nine feet above the next floor level. Employees were walking the beams and were not provided any type of fall protection (Exs. 8, 9; Tr. 46-53).

25. Compliance Officer Beall held a closing conference with Elliott Goldstein, respondent's safety director, after the October 7, 1975, inspection (Tr. 54).

DOCKET NO. 76-4276

26. On August 24, 1976, Compliance Officer Samuel Drexler conducted an inspection at respondent's work site located at Southwest 8th Street and 107th Avenue, Miami, Florida (Tr. 92-93). A three-story lab building for Florida International University was under construction (Tr. 101-102).

27. Upon entering the perimeter of the building under construction, Drexler traversed an accumulation of debris, rubble, cut-off lumber with protruding nails, building blocks and broken masonry (Exs. 10, 11; Tr. 93, 95).

28. Employees generally approached the building from the same direction taken by Compliance Officer Drexler (Tr. 93). Employees were observed walking over the debris at coffee breaks and lunch periods (Tr. 116). They did not follow any particular routes or avenues (Tr. 114).

29. The ground level of the building contained broken conduit pipe, wiring, wire strapping, broken masonry, sawed-off lumber with protruding nails, empty cardboard cartons and scraps of lumber. Employees of respondent had to traverse the ground level to reach the upper levels (Ex. 12; Tr. 96, 98, 104-105, 119). Similar conditions were observed on the second and third levels (Ex. 13; Tr. 98, 104). Employees of respondent were working on all three levels (Tr. 98, 101).

30. Certain passageways were kept cleared (Tr. 142).

31. At the time of the inspection, respondent was in the process of cleaning up the job (Tr. 123, 125-126, 135). Employees had been engaged in stripping forms on August 23, 1976, and August 24, 1976 (Tr. 125).

## RESPONDENT'S SAFETY POLICY

32. Respondent holds monthly meetings with its foremen to discuss safety problems and solutions. Written safety talks are issued to the foremen every week, and the foremen give a five-minute safety talk to their men. Respondent has a written safety outline defining safety duties and responsibilities for its foremen (Tr. 65-66).

33. When employees have been found violating company safety policy, disciplinary action, ranging from suspension to termination, has been instituted (Ex. B; Tr. 66, 68-69).

34. Respondent issued a memo to all its field personnel concerning personal protective equipment. Each employee was required to keep a copy of the memo and to sign a copy to return to his personnel file (Ex. A; Tr. 67-68). The memo provided, in part (Ex. A):

> "Prestressed Systems, in an effort to comply with this law, is furnishing and requiring the use of certain personal protective equipment. All employees must properly use and maintain this equipment according to these rules:
>
> * * * *
>
> 2. P.S.I. will furnish safety belts and lifelines to employees working near the perimeter of a slab which is at least 6 feet higher than the slab or ground below. These belts are to be worn and tied off to a structural member whenever the employee is within 5 feet of the edge and there are no approved guardrails or safety nets in place. The lifeline must limit all falls to no more than 6 feet.

* * * *

"4. Personal protective equipment must be inspected regularly and any damaged or worn equipment must be turned in to the foreman on the job for repair or replacement.

"You, the worker, are P.S.I.'s most important asset. These safety rules have been established for your protection. They must be obeyed in addition to any other safety regulations issued by the Company.

"FAILURE TO OBSERVE THESE RULES WILL RESULT IN DISCIPLINARY ACTION OR DISCHARGE."

OPINION

Respondent is engaged in the business of forming and concrete construction. The issues raised in this consolidated proceeding arose from separate inspections of two different work sites.

I DOCKET 76-4276

Following an inspection on August 24, 1976, of a work site located at Southwest 8th Street and 107th Avenue, Miami, Florida, respondent was issued a non-serious citation. A lab building at Florida International University was under construction at the time of the inspection. Respondent contested item one of the citation which alleges that it violated 29 C.F.R. § 1926.25(a)[1/]

---

1/ 29 C.F.R. § 1926.25(a) provides:

"(a) During the course of construction, alteration, or repairs, form and scrap lumber with protruding nails, and all other debris, shall be kept cleared from work areas, passageways, and stairs, in and around buildings or other structures."

by failing to keep debris cleared from the eastern approach to the building and from the first, second and third levels.

Section 1926.25(a) requires an employer to keep all debris cleared from work areas, passageways and stairs in and around buildings or other structures during construction, alteration, or repairs. There is no dispute that debris was scattered around the perimeter of the building and on the first, second and third levels. Olin Patterson, a carpenter for respondent, testified that passageways were kept clear (Tr. 142). There is no evidence to contradict his testimony. However, the compliance officer testified that he observed employees walking over the debris at the ground level and the eastern approach to the building at coffee breaks and during the lunch period (Tr. 116). It serves no useful purpose to clear passageways if employees are allowed to traverse the debris.

The compliance officer testified that the second and third levels contained debris similar to the approach to the building and the ground level. This type of debris is visually reflected in exhibits 10, 11 and 12. The debris on the second level was not as extensive as that shown at the approach to the building and the ground level (See exhibit 13). The evidence reflects that employees were working on all three levels, but does not indicate the specific areas of those levels in which employees were working. Furthermore, the evidence does not reflect the extent of the debris

in the work areas for the second and third levels. The complainant has failed to prove that the actual work areas or passageways on the second and third levels were not kept cleared. The fact that debris existed on the second and third levels and that employees worked on those levels does not per se establish that specific work areas on those levels were not kept clear. Since the evidence indicates passageways were kept clear, some evidence was necessary to show specific areas where employees were working and the condition of those areas.

The evidence establishes that respondent was in the process of doing some cleaning at the site. Under such circumstances, respondent argues that it was not the intent of 29 C.F.R. § 1926.25(a) to create a violation which arises when one is in the process of eliminating the conditions which might otherwise give rise to a violation. Respondent relies on the Judge's decision in Julius Nasso Concrete Corporation, 75 OSAHRC 79/D2, 3 BNA OSHC 1509, 1974-1975 CCH OSHD ¶ 19,832 (1975) and the Commission decision in Anning-Johnson Co., 76 OSAHRC 54/A2, 4 BNA OSHC 1193, 1975-1976 CCH OSHC ¶ 20,690 (1976), affirming the Judge's decision as to 29 C.F.R. § 1926.25(a).

In Julius Nasso Concrete Corporation, supra, the exposed employees were actually engaged in cleaning the floors. The Judge interpreted the standard to contain "an implicit exclusion

in respect of acts performed in the process of complying with its explicit mandate." Since the exposed employees were engaged in cleaning operations, it would have been grossly unfair to hold the employer in violation while his employees were in the process of accomplishing the cleaning necessary to comply with the standard. There has been no showing that the exposed employees in this case were actually engaged in the cleaning operation.

In Anning-Johnson Co., supra, the Commission upheld the Judge's decision to vacate the allegation on the basis that respondent maintained a force of approximately seven employees whose sole task was to remove all debris from an area before its employees entered to perform their work. In addition, the same work force removed all debris actually created by respondent's employees in the performance of their work. The rationale of the Commission is difficult to comprehend. The stipulation of the parties stated that the foreman was aware of the conditions and still permitted employees to work in debris areas. Unlike Julius Nasso Concrete Corporation, supra, the record does not disclose that only employees engaged in cleaning operations were working in debris areas. The Commission seems to be saying that the mere fact that an employer has employees assigned to clean up the site is sufficient to comply with the standard. While the exact implication of the Commission's decision is unclear, this Judge declines to interpret it to mean that the mere assigning of employees to clear a construction site complies with the standard.

Employees of respondent seen traversing the debris on the ground level and the approach to the building were not engaged in cleaning operations. The mere fact that someone was assigned to clean up the debris is insufficient to justify employees walking over and working in the debris. Time cards submitted by respondent reflect that three employees were engaged in a number of activities on August 23, 1976, and August 24, 1976, including some clean-up duties (See exhibit C). The employees spent a total combined time of 12 hours on August 23, 1976, and August 24, 1976, cleaning up the site. It is obvious that such a limited time was totally insufficient to accomplish the job.

The standard says that all debris shall be kept cleared from work areas, passageways, and stairs. The obvious intent is to protect employees from tripping and falling or stepping on a protruding nail. The fact some cleaning is being done at a particular site is not sufficient justification for ignoring the clear mandate of the standard unless the exposed employees are actually engaged in cleaning up the site to comply with the standard. The employees observed traversing the debris at the approach to the building and on the ground level have not been shown to have been engaged in cleaning operations. Accordingly, a violation as to the eastern approach to the building and on the ground level has been established.

## II DOCKET NO. 76-4278

On September 1, 1976, Compliance Officer John S. Ruggles, Jr., conducted an inspection at respondent's work site located at Palm Beach Lakes Boulevard and Congress Avenue, West Palm Beach, Florida. Respondent's employees were engaged in the construction of a ten-story office building and an adjacent garage. As a result of that inspection, a serious citation, a repeated citation and a non-serious citation were issued to respondent on September 8, 1976, The serious and repeated citations were contested.

### A. SERIOUS CITATION

The serious citation combines four alleged violations of the outrigger scaffold standards set forth at 29 C.F.R. § 1926.451(g). Two outrigger scaffolds were located side by side at the fifth level on the south side of the building. Complainant treated the two scaffolds as one for purposes of the citation. The scaffolds were located some 32 to 35 feet above the ground level.

1. Alleged violation of 29 C.F.R. § 1926.451(g)(5)

Complainant alleges that respondent violated 29 C.F.R. § 1926.451(g)(5)[2/] by failing to install guardrails and toeboards

---

2/ 29 C.F.R. § 1926.451(g)(5) states:

> "(5) Guardrails made of lumber, not less than 2 x 4 inches (or other material providing equivalent protection), approximately 42 inches high, with a mid-rail of 1 x 6 inch lumber (or other material providing equivalent protection), and toeboards, shall be installed at all open sides and ends on all scaffolds more than 10 feet above the ground or floor. Toeboards shall be a minimum of 4 inches in height. Wire mesh shall be installed in accordance with paragraph (a)(6) of this section."

at all open sides and ends of the scaffolds. Respondent concedes that no guardrails or toeboards were utilized.[3/] It argues that there was no direct evidence presented that its employees were out on the outriggers and exposed to any hazards and that employees had been instructed to use safety belts when working from the scaffolds.

The compliance officer did not observe anyone on the scaffolds during his inspection. He did observe a stack of four-by-fours on the scaffolds. Respondent's foreman, who accompanied the compliance officer on the inspection, informed the compliance officer that he and another employee had stacked the lumber on the scaffold some three to four days prior to the inspection. The foreman further informed the compliance officer that they did not wear safety belts and that the scaffolds were in the same condition as observed at the time of the inspection, i. e., they contained no guardrails or toeboards.[4/] Respondent offered no evidence to contradict the testimony of the compliance officer. The violation of 29 C.F.R. § 1926.451(g)(5) has been established.

---

3/ Photographs introduced as exhibits one through four clearly show the absence of guardrails and toeboards.

4/ Rule 801(d)(2)(D) of the Federal Rules of Evidence concerning admissions by party--opponent provides for the admission of "a statement by his agent or servant concerning a matter within the scope of his agency or employment made during the existence of the relationship." Under Rule 801 such an admission by the foreman was admissible.

2. Alleged violation of 29 C.F.R. § 1926.451(g)(1)

Complainant alleges that respondent violated 29 C.F.R. § 1926.451(g)(1)[5/] by failing to have the inboard end of the outrigger beams, measured from the fulcrum point to the anchorage point, at least 1-1/2 times the outboard end in length. Respondent does not contend that the inboard end of the outrigger beams was at least 1-1/2 times the outboard in length. It argues that while the outriggers did not strictly comply with the standard, the scaffold satisfied the minimum load bearing capabilities required by the standard.

Compliance Officer Ruggles testified on the basis of measurements made during the inspection that the length of the scaffold projecting outside the building was six feet and that the inboard length of the scaffold beams measured from the edge of the building was five feet. Respondent's general superintendent testified that the scaffold beams were six feet out and eight feet back (Tr. 73).

---

5/ 29 C.F.R. § 1926.451(g)(1) states:

> "(g) Outrigger scaffolds. (1) Outrigger beams shall extend not more than 6 feet beyond the face of the building. The inboard end of outrigger beams, measured from the fulcrum point to anchorage point, shall be not less than 1-1/2 times the outboard end in length. The beams shall rest on edge, the sides shall be plumb, and the edges shall be horizontal. The fulcrum point of the beam shall rest on a secure bearing at least 6 inches in each horizontal dimension. The beam shall be secured in place against movement and shall be securely braced at the fulcrum point against tipping."

There is nothing to indicate his testimony was based on measurements made by him. Assuming, arguendo, that the general superintendent was correct, respondent was still in violation of the standard since the inboard length would have had to be at least nine feet. The violation has been established.

3. Alleged violation of 29 C.F.R. § 1926.451(g)(3)

Complainant alleges that respondent violated 29 C.F.R. § 1926.451(g)(3)[6/] by utilizing scaffolds that were not designed by a registered professional engineer competent in the design of such

---

6/ 29 C.F.R. § 1926.451(g)(3) provides:

"(3) Unless outrigger scaffolds are designed by a registered professional engineer competent in this field, they shall be constructed and erected in accordance with Table L-13. Outrigger scaffolds, designed by a registered professional engineer, shall be constructed and erected in accordance with such design."

TABLE L-13--MINIMUM NOMINAL SIZE AND MAXIMUM SPACING OF MEMBERS OF OUTRIGGER SCAFFOLDS

| Maximum scaffold load. | Light Duty | Medium duty |
|---|---|---|
| | 25 p.s.f. | 50 p.s.f. |
| Outrigger size | 2 x 10 in. | 3 x 10 in. |
| Maximum outrigger spacing. | 10 ft. 0 in. | 6 ft. 0 in. |
| Planking | 2 x 10 in. | 2 x 10 in. |
| Guardrail | 2 x 4 in. | 2 x 4 in. |
| Guardrail uprights | 2 x 4 in. | 2 x 4 in. |
| Toeboards | 4 in. (minimum). | 4 in. (minimum). |

scaffolds and, in addition, the scaffolds were not constructed and erected in accordance with the requirements of Table L-13. Respondent submits that the scaffolds satisfied the minimum load capabilities required by the standard.

Respondent's foreman informed the compliance officer that the scaffolds had not been designed by a registered professional engineer. The foreman's admission was not disputed. However, respondent's vice-president of engineering, who is a registered engineer, testified that in his opinion the outrigger scaffold used by respondent had a load bearing capacity equal to that required by 29 C.F.R. § 1926.451(g)(3) and Table L-13 contained therein. His opinion was based on an erroneous fact. He assumed the full surface of the scaffolds was coverd with double sheets of three-quarter-inch plywood which he concluded was equal to 2 x 10 inch planking. The facts show that part of the surface of each of the scaffolds was covered with only one sheet of three-quarter-inch plywood. In addition, the plywood was in poor condition. One corner of the plywood in the single thickness portion was broken and moved downward under the pressure of a foot. The scaffold did not meet the requirements of Table L-13. The violation has been established.

4. Alleged violation of 29 C.F.R. § 1926.451(g)(4)

Complainant alleges that respondent violated 29 C.F.R. §

1926.451(g)(4)[7/] by failing to lay the planking tight. Complainant treated the two scaffolds as one. Each scaffold was constructed opposite a column. There was a 7-1/2 inch gap between the two scaffolds which resulted from the width of the column. Complainant treated the gap as being in the center of one scaffold.

The standard requires tight planking to within three inches of the building. Each scaffold complied with this requirement. The gap appeared between the two scaffolds. However, the 4 x 4's stacked across the two scaffolds indicate that respondent was not treating each scaffold with a separate identity. There was no way that guardrails could be separately installed on each scaffold since the 4 x 4's extended the length of both scaffolds (See exhibits 1-4).[8/] Since the obvious intent was to use the two scaffolds as one, there should not have been a gap between the two scaffolds. Employees were not restrained in any manner from stepping over the gap from one scaffold to the other. Accordingly, the violation has been established.

---

7/ 29 C.F.R. § 1926.451(g)(4) states:

> "(4) Planking shall be laid tight and shall extend to within 3 inches of the building wall. Planking shall be secured to the beams."

8/ Guardrails separately installed on each scaffold would have eliminated the gap. Employees on each scaffold would have been protected against the hazard.

B. REPEATED CITATION

Employees of respondent were working on a parking building located to the rear of the office building. Two employees of respondent were observed laying stringers to support plywood sheets which in turn would support a cement pour for the second level of the parking garage. Complainant alleges that respondent violated 29 C.F.R. § 1926.28(a) by failing to require the employees to wear appropriate personal protective equipment.

The photograph introduced as exhibit 5 shows two employees working on the parking garage. Respondent submits there was no direct evidence establishing that the employees were not wearing personal protective equipment. It is clear from the photograph that the employees are not wearing safety belts. Compliance Officer Ruggles testified that the two employees were subject to a fall of approximately ten feet (Tr. 18). There is no evidence to contradict a finding that the employees were not wearing personal protective equipment.

In Frank Briscoe Company, Inc., 76 OSAHRC 129/A2, 4 BNA OSHC 1729, 1976-1977 CCH OSHD ¶ 21,162 (1976) the Commission concluded that 29 C.F.R. § 1926.28(a) was a performance rather than a specification standard since it is not limited to particular hazards or to protection by particular methods. The Commission followed the rationale expressed in National Realty and Construction Co. v. OSAHRC , 489 F.2d 1257 (D.C. Cir. 1973) and concluded that where

complainant relies on 29 C.F.R. § 1926.28(a), he "must both allege the specific measures the cited employer should have taken to avoid [the] citation and prove the feasibility and utility of those measures." Thus, complainant must not only allege that safety belts should have been used but must also "prove the feasibility and utility" of using safety belts.

Complainant offered no evidence to show how safety belts could be utilized to protect the employees. Compliance Officer Ruggles testified that the two employees needed to be protected by doing their job differently. He offered no explanation as to how the employees could have used the belts. There is no evidence as to where the belts could be tied off. The employees were actually protected by doing the job in a different manner. Respondent planked over the stringers as the employees progressed outward. This provided a safe walking and working surface (Tr. 19-22).

Two employees were exposed to a potential fall of ten feet. However, respondent is charged with the failure to utilize appropriate personal protection. The record fails to establish the feasibility of utilizing safety belts. The fact respondent acceded to the opinion that a hazard existed and agreed to abate it by doing the job in a different manner does not support a conclusion that safety belts were feasible. The alleged violation is vacated.

## III VIOLATIONS OF 29 C.F.R. § 1926.451(g)(1), (g)(3), (g)(4) and (g)(5) CONSTITUTED A SERIOUS VIOLATION

Complainant alleges that the violations of 29 C.F.R. § 1926.451(g)(1), (g)(3), (g)(4) and (g)(5) constituted a serious violation within the meaning of section 17(k) of the Act. The occurrence of an accident because of an existing hazard in violation of the Act does not have to be substantially probable in order to be classified a serious violation. An accident must simply be possible. Serious and non-serious violations "are distinguished on the basis of the seriousness of injuries which experience has shown reasonably likely to occur." Natkin and Company, 73 OSAHRC 16/E3, 1 BNA OSHC 1204, 1971-1973 CCH OSHD ¶ 15,679 (1973). The probability of an accident occurring is relevant only to the gravity of the violation. See Emory H. Mixon, 73 OSAHRC 57/D11, 1 BNA OSHC 1500, 1973-1974 CCH OSHD ¶ 17,027 (1973).

Respondent's foreman was aware that he and another employee were unprotected while they were stacking the 4 x 4's on the two scaffolds. The scaffolds were some 32 to 35 feet above the ground level. A fall from a distance of 32 feet to a ground surface would certainly result in death or serious physical harm. The absence of guardrails, standing alone, is sufficient to justify classfying the violations as serious within the meaning of section 17(k) of the Act.

## IV PENALTY DETERMINATIONS

The Commission is the final arbiter of penalties in all contested cases. Secretary v. Occupational Safety and Health Review Commission and Interstate Glass Co., 487 F.2d 438 (8th Cir. 1973). Under section 17(j) of the Act the Commission is required to find and give "due consideration" to the size of the employer's business, the gravity of the violation, the good faith of the employer and the history of previous violations in determining the assessment of an appropriate penalty. The gravity of the offense is the principal factor to be considered. Nacirema Operating Company, Inc., 72 OSAHRC 1/B10, 1 BNA OSHC 1001, 1971-1973 CCH OSHD ¶ 15,032 (1972).

### A. Violation of 29 C.F.R. § 1926.25(a)

Employees were observed traversing debris at the eastern approach to the building and on the ground level. While respondent had cleaned some debris from the site, it is clear that its efforts were insufficient. Employees were permitted to traverse the debris. A penalty of $25 is deemed appropriate for the violation.

### B. Violations of 29 C.F.R. § 1926.451(g)(1), (g)(3), (g)(4), and (g)(5)

The outrigger scaffolds exposed two employees to a potential fall of 32 to 35 feet. No attempt was made to protect the employees. The employees were stacking some 4 x 4's on the scaffolds. The period of exposure was undoubtedly brief. They were working from

a flat surface. A penalty of $500 is considered appropriate for the violation.

## CONCLUSIONS OF LAW

1. Respondent, at all times material to this proceeding, was engaged in a business affecting commerce within the meaning of section 3(5) of the Act.

2. Respondent, at all times material to this proceeding, was subject to the requirements of the Act and the standards promulgated thereunder.

3. On August 24, 1976, respondent permitted employees at its work site located at S.W. 8th Street and 107th Avenue, Miami, Florida, to traverse debris located at the eastern approach to the building and on the ground level in violation of 29 C.F.R. § 1926.25(a).

4. On September 1, 1976, employees of respondent were working at a work site located at Palm Beach Lakes Boulevard and Congress Avenue, West Palm Beach, Florida. Two outrigger scaffolds were located at the fifth level of a ten-story office building under construction.

5. The outrigger scaffolds were not designed by a registered professional engineer and were not constructed in accordance with Table L-13 as required by 29 C.F.R. § 1926.451(g)(3).

6. The outrigger scaffolds contained no guardrails or toeboards in violation of 29 C.F.R. § 1926.451(g)(5).

7. The inboard end of the outrigger beams, measured from the fulcrum point to the anchorage point, was less than 1-1/2 times the outboard end length and was in violation of 29 C.F.R. § 1926.451(g)(1).

8. The two outrigger scaffolds were being used as though they were one. There was a 7-1/2 inch gap between the two scaffolds. Since the two scaffolds were used as one, the gap was in violation of 29 C.F.R. § 1926.451(g)(4).

9. Two employees at the Palm Beach Lakes Boulevard work site were working on the second level of a parking building. They were walking along eight-inch concrete beams and exposed to a fall of ten feet. Respondent was not in violation of 29 C.F.R. § 1926.28(a) since complainant failed to establish the utility and feasibility of safety belts.

10. The violations of 29 C.F.R. § 1926.451(g)(1), (g)(3), (g)(4), and (g)(5), in the aggregate, were serious within the meaning of section 17(k) of the Act.

11. A penalty of $25 is assessed for the violation of 29 C.F.R. § 1926.25(a).

12. A penalty of $500 is assessed for the serious violation.

## ORDER

Based upon the findings of fact and conclusions of law, it is

ORDERED: (1) That item one of the non-serious citation issued to respondent on September 1, 1976 (Docket No. 76-4276), is affirmed as to the eastern approach to the building and the first or ground level and is vacated as it pertains to the second and third levels;

(2) That the penalty proposed for item one of the non-serious citation issued to respondent on September 1, 1976, is modified to assess a penalty of $25;

(3) That the serious citation issued to respondent on September 8, 1976 (Docket No. 76-4278), is affirmed;

(4) That the penalty proposed for the serious violation determined in docket number 76-4278 is modified to assess a penalty of $500; and

(5) That the repeated citation and penalty proposed therefor issued to respondent on September 8, 1976 (Docket No. 76-4278), are vacated.

Dated this 20th day of June, 1977.

DECISION

Before: ROWLAND, Chairman; CLEARY and COTTINE, Commissioners.

BY THE COMMISSION:

Administrative Law Judge Henry F. Martin, Jr., affirmed a citation charging Respondent, Metro Electric, Inc., with a serious violation of the occupational safety and health standard at 29 C.F.R. § 1926.500(d)(2) and assessed a $50 penalty. Having reviewed the record and the parties' arguments, we agree with the judge's reasoning and conclusion. Accordingly, we adopt the judge's decision. See Gulf Oil Co., 77 OSAHRC 216/B10, 6 BNA OSHC 1240, 1978 CCH OSHD ¶ 22,737 (No. 14281, 1977).

SO ORDERED.

DECISION AND ORDER

MARTIN, Judge:

This is a proceeding brought by the Secretary of Labor, United States Department of Labor, pursuant to the provisions of Section 10 of the Occupational Safety and Health Act of 1970 (29 U.S.C. 651, et seq.) hereinafter referred to as the "Act". On April 20, 1979, a compliance officer of the Occupstional Safety and Health Administration conducted an inspection of respondent's workplace located at a construction site at 2255 North Expressway, Brownsville, Texas. As a result of the inspection respondent was issued a serious citation on May 14, 1979 and a penalty of $360 was proposed by complainant.

Following the issuance of the citation respondent filed a timely notice of contest.[1/] Thereafter, complainant filed a formal complaint which was answered by respondent's attorney. Pursuant to formal notice a hearing was held in this proceeding in Brownsville, Texas on October 30, 1979 at which time complainant was represented by Robert L. Sims, Esquire and Douglas N. White, Esquire, of the Regional Solicitor's Office, Department of Labor, Dallas, Texas and respondent was represented by its attorney, Norton A. Colvin, Jr., Esquire, of Brownsville, Texas. Post-trial briefs were submitted by both parties.

Respondent was alleged to have violated the provisions of Section 29 C.F.R. 1926.500(d)(2) because standard guardrails or the equivalent were not provided for the protection of its employees using runways, 4 feet or more above ground level on several different floor levels on two wings of Motel 6 in Brownsville, Texas, which was then under construction.[2/]

The issues to be resolved in this proceeding are whether respondent, an electrical sub-contractor on a multi-employer construction worksite,

---

1/ Another citation, alleging two non-serious violations, was not contested and the same has become a final order pursuant to Section 10(a) of the Act.

2/ Section 29 C.F.R. 1926.500(d)(2) provides as follows:

> "Runways shall be guarded by a standard railing, or the equivalent, as specified in paragraph (f) of this section, on all open sides, 4 feet or more above floor or ground level. Whenever tools, machine parts, or materials are likely to be used on the runway, a toe board shall also be provided on each exposed side."

violated the provisions of 29 C.F.R. 1926.500(d)(2) and if so, whether the violation was one of a serious nature within the meaning and intent of Section 17(k) of the Act. Also to be determined is whether the requested penalty is appropriate.

The salient facts are not in dispute. On April 20, 1979 respondent had five employees engaged in installing electrical outlets at several different locations on the Motel 6 construction site on the second and third levels of the A and B wings. There were no guardrails or equivalent protection along the walkways which employees would have to traverse or at the work stations where respondent's employees were engaged. The workmen were exposed to falls of approximately 9 feet and 17 feet at the second and third levels respectively. The walkways were approximately 4 feet wide and in one instance the useable width of the walkway was reduced from 4 feet to 2 feet because of an obstruction created by a stack of form lumber on the walkway. (Tr. 53).

Complainant's exhibit C-1 is a rough drawing showing the runways or walkways in question. Exhibits C-2 through C-8 reveal the absence of guardrails along the outer edge of the walkways. Exhibits C-4, C-5, and C-6 reveal a large stack of forming lumber which severely restricts the width of the walking area. Exhibit C-6 shows one of respondent's employees (Mr. Esquill) on the third level of the A wing. The workman in exhibit C-7 (Mr. Owen) is shown using an electric drill with his right foot very close to the outer edge of the walkway on the third level of the B wing. He was engaged in installing a light fixture. The runway between the A and B wings was reported to be approximately 11 feet long and there

were no guardrails on either side.

Respondent has contended that the violation in question should have been charged against the general contractor who had authority to provide the standard railings. He also stated that other sub-contractors who were using the walkway in question were not cited for a violation. Respondent's principal argument was that the runways were not under the control or authority of respondent and that respondent should not have been charged with violating the cited standard.

Respondent's argument cannot prevail in face of the Review Commission's precedent cases. In Anning-Johnson Co., Docket No. 4409, 1975-76 CCH OSHD para. 20,690 and Grossman Steel and Aluminum Corp., Docket No. 12,775, 1975-1976 CCH OSHD para. 20,691, the Review Commission held that a non-creating and non-controlling sub-contractor on a multi-employer construction site can defend by showing that it took realistic steps as an alternative to literal compliance with the standard in order to protect its employees.[3/]

---

3/ In Grossman, the Review Commission stated:

> "Simply because a sub-contractor cannot himself abate a violative condition does not mean that it is powerless to protect its employees. It can, for example, attempt to have the general contractor correct the condition, attempt to persuade the employer responsible for the condition to correct it, instruct its employees to avoid the area where the hazard exists if this alternative is practical, or in some instances provide an alternate means of protection against the hazard. We therefore expect every employer to make a reasonable effort to detect violations of standards not created by it but to which its employees have access and, when it detects such violations, to exert reasonable efforts to have them abated or take such other steps as the circumstances may dictate to protect its employees. In the absence of such actions, we will still hold each employer responsible for all violative conditions to which its employees have access."

Respondent's foreman, Mr. Fangmann, testified that he would not expose an employee to hazardous conditions and did not believe that any of his employees were subjected to dangerous conditions on the motel jobsite. When questioned as to whether he had ever approached the general contractor about installing guardrails he stated that he had inquired about the matter and was advised that they were on the way. Mr. Fangmann also testified that employees are cautioned to be careful. This clearly does not fall within the guidelines of Anning-Johnson and Grossman Steel which requires reasonable efforts to have the hazard abated.

Although respondent's foreman contended that his employees moved around too much to be tied off to the building this would not appear to be a valid reason when an employee is installing a light fixture on the outside of the building (see exhibits C-7 and C-8). An employee could have tied a lanyard onto the building framework.

The evidence in the record discloses that respondent's employees were subjected to the hazard of falls from the second or third level and that broken bones or more serious injuries might result. Respondent's foreman (or assistant foreman) was on the job at all times and his knowledge can be imputed to respondent. A serious violation within the purview of Section 17(k) of the Act has been established.[4/] Based upon

---

4/ Section 17(k) of the Act provides as follows:

> "For purposes of this section, a serious violation shall be deemed to exist in a place of employment if there is a substantial probability that death or serious physical harm could result from a condition which exists, or from one or more practices, means, methods, operations, or processes which have been adopted or are in use, in such place of employment unless the employer did not, and could not with the exercise of reasonable diligence, know of the presence of the violation."

all of the evidence in the record it is concluded that a penalty of $50 will satisfy the remedial purposes of the Act.

ORDER

Based upon the entire record it is hereby ORDERED that:

1. Citation 1 issued on May 14, 1979 be and the same is hereby affirmed.

2. A penalty of $50 is assessed therefor.

So ORDERED this the 13th day of March 1980 in Dallas, Texas.

DECISION

Before ROWLAND, Chairman; CLEARY and COTTINE, Commissioners.

BY THE COMMISSION:

A decision of Administrative Law Judge William E. Brennan is before the Commission pursuant to section 12(j)[1/] of the Occupational Safety and Health Act of 1970, 29 U.S.C. §§ 651-678 ("the Act"). United States Steel Corporation ("USS" or "Respondent") takes exception to the judge's affirmance of a citation issued in connection with its open hearth furnace operation in Fairless Hills, Pennsylvania. The citation and complaint issued by the Secretary of Labor ("the Secretary") allege that USS failed to comply with section 5(a)(1) of the Act, the "general duty clause,"[2/] in that:

---

1/ 29 U.S.C. § 661(i).

2/ Section 5(a)(1), 29 U.S.C. § 654(a)(1), provides:

(continued on next page)

> A safe and healthful workplace free of recognized hazards likely to cause death or serious physical harm is not provided to employees in the open hearth in that employees are required to change oxygen lances atop the furnaces with molten metal in the furnaces. This process involves hazards associated with water becoming entrapped below molten metal.

The issues on review are whether the administrative law judge erred in deciding the case on a theory other than that agreed upon at the outset of the hearing, and whether a preponderance of the evidence demonstrates a violation of the general duty clause.[3/]

I

The investigation which led to the citation in this case was conducted in response to an employee complaint to the Occupational Safety and Health Administration ("OSHA") of unsafe work conditions. Specifically, millwrights at the Fairless Works objected to a newly instituted work rule which required that oxygen lances be replaced in furnaces

---

2/ (continued)

Sec. 5(a) Each employer —

> (1) shall furnish to each of his employees employment and a place of employment which are free from recognized hazards that are causing or are likely to cause death or serious physical harm to his employees.

3/ Former Commissioner Barnako's direction for review requested submissions from the parties on two issues: (1) whether the trial judge committed reversible error in affirming that item of the citation which alleged that employees required to change oxygen lances are exposed to hazards associated with water becoming trapped below molten metal, and (2) if the judge did not err, whether he assessed a proper penalty. In its petition for review USS argued, in addition, that the judge erred in affirming a second item of the citation alleging that employees involved in lance changes could be knocked off balance and onto the roof. That item was not directed for review and is therefore not before us. See Henry C. Beck Co., 80 OSAHRC 67/D13, 8 BNA OSHC 1734 n.2, 1980 CCH OSHD ¶ 24,590 at p. 30,169-3 n.2 (No. 77-963, 1980).

containing molten metal. Previously the practice had been to change inoperative lances before molten metal was added to a furnace. The millwrights told the OSHA compliance officer that the new procedure was dangerous because it could cause water to become entrapped in molten metal and explode.[4/]

Because the issues on review turn largely on questions of evidence, and that evidence tends to be highly technical in nature, we begin our discussion with a description of the open hearth furnace operation, according to the evidence developed below. USS's nine open hearth furnaces resemble large bathtubs, each measuring 60 to 90 feet by 12 to 20 feet, with an interior depth of 15 to 16 feet. They are constructed of heat-resistant basic bricks mounted on steel rods and are protected from the intense heat by a network of pipes which carry cooling water over the structures, particularly around doors and other apertures. Furnace doors are fitted with "wicket holes" through which the millwrights can observe the contents of the furnace and through which samples of molten metal are extracted for analysis.

Steel is produced in the open hearth operation at a rate of about 750 "heats" per month. A heat begins with the charging of limestone, scrap metal, and ore into the empty furnace. Molten iron is then poured in. The initial interaction of hot iron, ore, and scrap metal causes a violent boiling action which can send molten metal flying out of the furnace. For this reason "Danger" signs are posted on the charging floor

---

4/ The change in work practices was the subject of an arbitration proceeding. The board of arbitration declined to rule on the merits of the millwrights' complaint, but determined that USS had failed to comply with its collective bargaining agreement by attempting to negotiate the terms of the new work rule directly with the millwrights rather than through the company's Joint Health and Safety Committee.

in front of the furnace before hot iron is added, and employees are kept at least 40 feet from the furnace doors until the foreman determines that the bath has stabilized. This violent period usually lasts one to two hours. Thereafter the mixture "cooks" anywhere from four to eight hours, until the desired grade of steel has been produced and is tapped off.[5/] As the mixture cooks, impurities called slag rise to the surface. The furnaces are designed so that some of the slag is removed through openings in the furnace, but a layer three to four inches thick generally remains throughout the heat. Temperatures inside the furnace during a heat range from 2300 to 2900 degrees Farenheit.

In the mid-1950s it was discovered that the heat time could be reduced by about half if oxygen is blown into the bath as it cooks. The oxygen is pumped into the furnace through "lances," or "jets," which are 18-foot steel pipes,[6/] six and one half-inches in diameter, weighing approximately 900 pounds. Each furnace is equipped with two or three lances, suspended vertically by overhead crane through eleven-inch holes in the roof. Oxygen enters the lance at its top end, which protrudes above roof level, and is blown out through oxygen ports in the bottom, the "head." Each lance is protected from the intense heat by cooling water which is circulated through the pipe's interior, entering and exiting through two

---

5/ The administrative law judge found as fact that the bath is unstable from the moment molten iron is added to the ore and scrap until refined steel is tapped off and that this entire period lasts about one and one-half hours. This is error. The record establishes that the period of instability or turbulence to which the judge referred is followed by at least three to four hours of "cooking" time during which the bath remains stable unless ore is added or substantial water leaks develop.

6/ The judge stated in his decision that the lances are 16 feet long. However, Exhibit C-17, which is a blueprint of one of USS's furnaces, shows that the overall length of a lance is 18 feet.

two-inch ports at the top of the lance. A fully functional lance holds 18 gallons of water.

The lances are subject to two types of malfunction. The oxygen ports can become clogged, and substantial water leaks can develop. In either event, the non-operational lance is pulled up and away from the metal bath, its oxygen and water supplies are turned off at the source, and the flow of oxygen to the remaining lance or lances is increased. Until 1975, if all lances in a furnace failed during the heat, the heat was simply continued without benefit of added oxygen at the slower rate necessary to that process. In May 1975, however, USS directed the millwrights to change one lance if all lances in a furnace failed, even while the furnace contained molten metal, so long as the foreman had determined that the bath was stable.

The procedure for changing a lance is essentially the same whether or not the furnace contains molten metal. The replacement lance is suspended by a cable and moved by a crane from the charging floor to the area above the furnace where three men standing on girders and beams directly above the roof push and pull the suspended pipe into the lance hole. Once the tip of the lance has been maneuvered into position, its water and oxygen supplies are turned on. The lance is then lowered until its head is directly above but not touching the bath. A man standing on the charging floor watches the lance's descent through the wicket hole and signals to the crane operator when the lance has reached its proper depth. Due to the great weight of the lance and the limited clearance above the furnace roof, it is not uncommon for the lance to bump into and break water pipes on the roof, causing water to leak into the furnace.

As the bath cooks it is in a constant state of upheaval, much like a pot of boiling candy. Stringers of molten metal are sometimes tossed up from the surface and even out of the furnace itself. This boiling action can be significantly increased by water leaks, which are an unavoidable accompaniment to the process. Water pipes are often broken by unmelted scrap and ore as they are tossed about in the furnace, or by the oxygen lances in transit over the roof. In addition, the lances themselves can develop water leaks. When large amounts of water leak into a furnace the normal agitation of the bath is increased. This is particularly true when the water is released beneath the surface of the bath, as in the case of a lance head becoming submerged in molten metal and the casing being melted away before the water supply is turned off. In addition to the increased agitation caused by water leaks, the steam which results pours out of the furnace, pushing with it flames and smoke.

Another cause of increased turbulence in the bath is the addition of limestone or ore to the molten metal at an advanced stage of the heat. When ore is added to reduce the temperature of the bath or to adjust the grade of steel being produced, the initial interaction between the ore and the molten metal releases gases which cause an intense boiling action capable of tossing hot metal out of the furnace.

The record establishes that there are three reasons why a lance change would not be made during the period of instability caused by addition of ore to molten metal. First, instability in the bath is readily apparent to the melter foreman and first helper, whose job it is to assess the stability of the bath at all stages of the heat. Under the new procedure a molten metal lance change would be prohibited over an unstable bath. Second, lance failure is normally manifested by reduced

temperature in the bath. The bath cannot be tested for temperature if it is unstable. Therefore, lance failure and the need to replace a lance will not be apparent until the bath has stabilized. Third, a lance change is only made if all the lances are inoperative. In such a situation, however, the temperature of the bath drops and it would not be necessary to add ore to reduce the temperature.

II

A

On the first day of the hearing the parties and the administrative law judge agreed that the issue to be tried was whether the practice of changing oxygen lances over molten metal will result in entrapment of water and explosion. USS conceded that if water is trapped below molten metal an explosion can result, but denied that the practice of changing lances over molten metal will cause entrapment of water.

During the five days of the hearing frequent reference was made to the limited scope of the Secretary's charge:

> The Judge: I think the pleadings and the documents within the docket file pretty much reflect at least part of that position. That is, that the Respondent does not agree that there is a danger of water entering into the molten metal because of the practice of changing the oxygen lances; but perhaps we have saved some time by stipulating that getting water into the metal is a recognized hazard.
>
> The Secretary: Well, once water is into the metal and entrapped in the metal, that is a recognized hazard. Really, the issue rendered by that item is whether or not the practice of changing lances will result in water becoming entrapped.
>
> The Judge: That is the way I read the file. All right. Any further stipulations?

* * *

The Secretary: It is the theory of the Government that the recognized hazard which is an explosion, can be the result of changing oxygen lances during the time molten metals are in the furnace.

* * *

The hazard, of course, is the potential of an explosion. Cited in the citation is the practice which by its nature may lead to that possibility.

* * *

The Judge: Millwrights don't want to be up on that roof if there is a chance of a tube of water falling into that hot metal because they are convinced . . . that you can wind up with an explosion.

* * *

[T]he question there is when the lance is being changed with hot metal in the furnace, is there a realistic possibility of an explosion or other type of occurrence because of that process which would endanger the Millwrights that are doing the job.

* * *

There has to be encapsulation for explosion. We then come to the question of what are the realistic possibilities of such encapsulation because of the oxygen lance procedure?

* * *

What I am asking you . . . to do is try and prove to these Millwrights that their fear of a lance exploding is not founded on fact.

On occasion USS objected to evidence on the ground that it was not probative of an issue in the case:

The Union: Now, can you relate some of the causes of a violent reaction insofar as they are related, let's say to a water problem?

USS: Your Honor, I object. I think again we are going beyond the scope of direct examination. I also object on grounds of relevancy because that is not the issue in this case.

The Court: Technically you are right, Mr. Carney.

* * *

The Union: Can you describe for us the type of damage caused by the addition of water or after the addition of hot metal and such violent reactions?

USS: Your Honor, I object again. I think we are just going far afield in terms of talking about -- in extensive detail a reaction which is not at issue in this case.

In deciding the case, however, the judge did not rule on the issue framed by the parties. He acknowledged that the question for decision was whether the changing of lances over molten metal would result in entrapment of water, causing explosions, and that "Complainant's evidence, in major part was aimed at establishing this possibility whereas Respondent's evidence was directed to showing no such realistic possibility exists." Nevertheless, he concluded that the record when taken as a whole shows that the real danger posed by the lance change procedure is that it brings employees within range of molten metal eruptions caused by factors other than the lance change itself. "The chance of explosion or 'violent eruptions,' from many unpredictable water sources, with the risk of partial roof damage or collapse, and the spraying of molten steel, is real, based on the total evidence of the record."

On review USS argues that it was denied due process of law when the judge changed the issue in the case after the hearing and without affording USS an opportunity to present argument or evidence on the new issue. USS points to the passages in the record quoted above in which the judge stated that the hazard at issue was explosion caused by the lance change procedure and notes that although the judge states that the broader issue was specifically tried by the parties, he cites no

evidence in the record that any issue other than that agreed upon at the outset was being litigated. Finally, USS points out that its brief to the judge was limited to the question of whether the lance change procedure could cause entrapment of water.

B

We agree with USS that the judge acted improperly in finding a violation based on possible eruptions of molten metal from causes other than a lance change. The citation was limited to a potential hazard resulting from a lance change, and statements made at the hearing by all parties and the judge establish that the parties did not intend to expand the charge beyond that contained in the citation. It was therefore error for the judge to decide the case on a different issue. "It is patently unfair for an agency to decide a case on a legal theory or set of facts which was not presented at the hearing." National Realty and Construction Co. v. OSHRC, 489 F.2d 1257, 1267 n. 40 (D.C. Cir. 1973).

We recognize that the millwrights are genuinely concerned for their safety and that their concern extends beyond the issue tried by the parties.[7/] However, the Commission's decision must be based on evidence

---

7/ Although we do not rule on the broader issue framed by the judge, we note several errors in the judge's analysis of the evidence, which cast doubt on the accuracy of his conclusion that millwrights performing a molten metal lance change would be exposed to hazards arising out of the ordinary operation of the furnace. The record establishes that there is a period of extreme turbulence immediately after the addition of molten iron to the scrap and ore, that this period lasts approximately one and one-half hours, and that thereafter the mixture cooks for several more hours in a relatively stable manner unless certain specified events occur. The judge, however, mistakenly concluded that the one and one-half hours of extreme turbulence constituted the entire cook time, so that millwrights going up on the roof after addition of molten iron are necessarily exposed to a highly agitated bath. See note 5 supra. He also concluded that until the institution of the new lance change procedure millwrights were never required to go up on the roof after hot iron had

(continued on next page)

of record as it pertains to the Secretary's theory of the case. The Secretary chose to limit the charge to the hazard of entrapment of water in molten metal as caused by the lance change procedure. During the five days of the hearing the judge and the parties repeatedly referred to the limited nature of the charge. Evidence of nonentrapment hazards created by the ordinary operation of the furnace was relevant to the agreed-upon charge because it provided background information necessary for an understanding of this highly technical operation, and because the millwrights who provided much of this testimony did so in response to the questions regarding the basis of their fears of the molten metal lance change procedure. Under these circumstances USS did not receive fair warning that a broader issue was being tried.

III

A

Section 5(a)(1) requires employers to provide their employees workplaces "free from recognized hazards that are causing or are likely to cause death or serious physical harm." Numerous Commission and court de-

---

7/ (Continued)

been added to the furnace. However, as indicated at note 9, infra, there is unrebutted testimony in the record that millwrights have traditionally gone up on the roof, without objection, to repair door frames while the furnace contains molten metal. The judge also disregarded entirely the testimony of the two expert witnesses on the ground that it related "chiefly to the scientific physics of explosions as they might be caused by an oxygen lance falling into a furnace after the addition of hot metal. . . ." However, inasmuch as the experts' testimony was relevant to the case, the judge's reason for disregarding it is not valid. The judge also improperly rejected in large part the testimony of USS's Division Superintendent regarding precautionary measures that would be taken before and during a lance change on the ground that this witness was not required to change lances over molten metal himself.

cisions have interpreted this language and have given various formulations of the elements the Secretary must prove in order to establish that an employer violated section 5(a)(1). See, e.g., Baroid Division of NL Industries, Inc. v. OSHRC, 660 F.2d 439 (10th Cir. 1981); Whirlpool Corp., 79 OSAHRC 32/A14, 7 BNA OSHC 1356, 1979 CCH OSHD ¶ 23,552 (No. 9224, 1979), vacated and remanded on other grounds, 645 F.2d 1096 (D.C. Cir. 1981). In Bomac Drilling, Division of TRG Drilling Corp., 81 OSAHRC 45/A2, 9 BNA OSHC 1681, 1981 CCH OSHD ¶ 25,363 (No. 76-450, 1981), the Commission expressed the elements of a section 5(a)(1) violation in a manner that differed from most prior court and Commission decisions by including the reasonable foreseeability of an incident as a distinct element of a violation:

> In order to establish a section 5(a)(1) violation, the Secretary must show that an employer failed to render its workplace free from a hazard that is recognized, the occurrence of an incident was reasonably foreseeable, and the likely consequence in the event of an incident was death or serious physical harm to its employees . . . . The Secretary must also demonstrate that there were feasible means available to abate the hazard.

9 BNA OSHC at 1691, 1981 CCH OSHD at p. 31,547 (citations omitted). In a concurring opinion in Bomac, Commissioner Cleary criticized the inclusion of the reasonable foreseeability of an incident as a separate element of a section 5(a)(1) violation. He noted that the facts relied on by the majority to conclude that an incident was reasonably foreseeable were the same as those on which they found that the employer had failed to free its workplace from a recognized hazard. Thus, he considered that including the reasonable foreseeability of an incident as a separate element of a violation simply added an unnecessary complication to the analysis of section 5(a)(1) cases.

We conclude that the reasonable foreseeability of an incident should no longer be considered a separate element of a section 5(a)(1) violation.

In addition to agreeing with Commissioner Cleary's rationale in Bomac, we note that the United States Court of Appeals for the Second Circuit has specifically disapproved of the Commission's application of "reasonable foreseeability" to a section 5(a)(1) case. Pratt & Whitney Aircraft v. Secretary of Labor, 649 F.2d 96 (2d Cir. 1981). Moreover, other courts of appeals that have decided section 5(a)(1) cases have done so without resorting to a discussion of whether an incident was reasonably foreseeable. Baroid Division of NL Industries, Inc. v. OSHRC, supra; St. Joe Minerals Corp. v. OSHRC, 647 F.2d 840 (9th Cir. 1981); Whirlpool Corp. v. OSHRC, 645 F.2d 1096 (D.C. Cir. 1981); Empire Detroit Steel Division, Detroit Steel Corp. v. OSHRC, 579 F.2d 378 (6th Cir. 1978); Getty Oil Co. v. OSHRC, 530 F.2d 1143 (5th Cir. 1976); National Realty & Construction Co. v. OSHRC, supra. The disparity between the formulation stated in Bomac and that stated by such a large number of courts of appeals is a potential source of confusion and fruitless litigation. Accordingly, we overrule Bomac to the extent it held that the reasonable foreseeability of an incident is a distinct element of a section 5(a)(1) violation.

B

The citation alleges that USS failed to render its workplace free of the hazard of explosions resulting from water becoming entrapped below molten metal as a result of a lance change. USS contends that a lance change over molten metal cannot lead to water entrapment and a resultant explosion. Although the administrative law judge did not rule on this issue, we need not remand for further findings of fact. The Commission, not the administrative law judge, is the ultimate trier of fact. Accu-Namics, Inc. v. OSHRC, 515 F.2d 828 (5th Cir. 1975), cert. denied, 425 U.S. 903 (1976).

Both USS and the Secretary produced expert testimony on the question of entrapment explosions, Geoffrey Belton for the Secretary, and Chester Bieniosek for USS. Although they disagreed sharply in several respects, Belton and Bieniosek were in complete agreement that water released below the surface of the bath will normally vaporize and come to the top rather than become entrapped. An explosion due to entrapment of water occurs only if water is subjected to extreme heat while caught behind a solid barrier which prevents its escape as it vaporizes and expands. USS's expert, Bieniosek, explained how an entrapment explosion of this type can occur in an open hearth furnace. Water, particularly ice or snow, is sometimes mixed in with the ore charged at the bottom of a furnace. When molten iron is poured onto the ore and scrap, a "skull" of solid metal can form temporarily between the water at the bottom of the furnace and the hot iron. As the heat transfers through the skull, the water beneath evaporates, expands, and builds up sufficient pressure to blow through the skull. Also, water is sometimes trapped inside the batteries mixed in with the scrap metal. Bieniosek testified that the potential for this kind of explosion is one of the reasons the danger sign is posted on the charging floor until the melter foreman is certain that the mixture in the furnace has stabilized.

The two experts also agreed that if a lance containing water were to fall into the bath, if its water ports were to become blocked, and if water were trapped inside, the lance could explode. Further, both experts stated that it is not possible to calculate with mathematical certainty the rate and force with which steam would issue from the lance or the rate at which slag would solidify in the ports. They reached differing conclusions, however, as to whether water could actually become entrapped in a fallen lance.

Belton, the Secretary's expert, hypothesized that a lance could fall into the furnace and water could become trapped inside if the lance fell through the lance hole at about a 30-degree angle[8/] or if it fell through a large hole in the roof caused by a collapse of the brick and metal structure. The lance would descend into the bath like a falling spear, bouy back up, and come to rest floating horizontally in the slag layer. The slag would begin to solidify in the ports immediately upon contact with the lance because the lance would be much colder than the slag. In Belton's opinion this solidifying process would occur more rapidly than the water inside the lance would turn to steam. Consequently the water would be trapped inside as it vaporized and expanded, and eventually the lance would explode.

In Bieniosek's opinion, the chance of this happening is "practically zero" because steam would rush out of the ports with sufficient force and speed to prevent slag from blocking the ports. Bieniosek stated categorically that the extremely high temperature and large quantity of molten metal surrounding the lance would cause the water inside to vaporize so quickly and with such force that it would blow out of the ports before they could become blocked. Even if it were possible for a layer of slag to obstruct the ports completely, that slag would be so weak and thin that the steam could easily break through. He stated that one reason for the slag's inability to form a strong barrier in the ports is that it is a complex material that does not solidify at

---

8/ The lance must fall at an angle in order to clear the roof, because the lance is approximately 18 feet long and the furnace interior is only 15-16 feet deep. On the other hand, the lance must not fall at too oblique an angle or it will be caught in the lance hole, which is only 11 inches in diameter.

a given temperature, but "goes through a range of temperatures during the solidification process which means for a considerable time there is a mixture of solids and liquid in the slag."

We find Bieniosek's testimony more convincing than Belton's for the following reasons. Belton predicated his hypothesis on several factors not present at the cited furnaces. He assumed a slag depth of eight to twelve inches, but it was the uncontradicted testimony of USS's plant superintendent that the maximum slag depth is three to four inches. He assumed the water ports are one and one-half inches in diameter, but blueprints in evidence show that the ports are two inches in diameter. His hypothesis required that the lance fall through the lance hole at a 30-degree angle or through a large hole in the roof, but he specifically stated he had made no effort to calculate the likelihood of a lance falling at the requisite angle, and it was the uncontradicted testimony of the Fairless Division Superintendent and the Open Hearth General Foreman of Maintenance that a lance could not fall into the furnace due to a collapse of the roof. Both witnesses testified that the network of steel rods on which the bricks are mounted would make it impossible for large sections of roof to collapse, and that a lance swinging above the roof would be caught by the pipes and girders above the roof. Moreover, Belton did not state his opinion with any degree of certainty. Although he stated on direct that it is "very likely" that the water ports would become clogged with solidified slag before steam could escape, on cross examination he conceded that "in general [I] think the solidification is probably less likely than the evolution of steam from the nozzles." Further, Bieniosek had more professional experience in the matters at issue than Belton. Belton stated that he had no direct experience with

oxygen lances, had never personally observed a lance change, and had no professional experience working with the interaction of liquid water and steel. Bieniosek, on the other hand, described extensive experience in the interaction of oxygen and water with molten metal and had observed oxygen lances in operation for 20 years. He stated that during that time he had never seen or heard of an explosion anywhere caused by a fallen lance. Finally, he gave his expert opinion without reservation.

The two experts also testified regarding the possibility that large quantities of water floating on top of the bath could cause an entrapment explosion. According to Belton, if water were to pour into the furnace at a rate of 250 gallons per minute, either from a broken lance or from pipes broken by the lance in its progress over the roof, not all the water would vaporize. Instead, a layer of steam would form on top of the slag, and liquid water would float on that. If a lance, or bricks or pipes knocked loose by a lance, were then to fall into the furnace, they would travel through the slag and into the molten metal, creating a pathway into the bath. Liquid water would follow in the pathway and molten metal would close in behind the water. Although ordinarily water in molten metal does not explode, the combination of splashing, impact, and high temperature would result in explosion. Belton based his opinion on a study in which water was sprayed from a hose onto molten aluminum. However, he was unable to give a definite opinion as to whether a brick or lance falling into the furnace would have sufficient impact to cause an explosion. He stated that the degree of impact required for such an explosion, is something "not well understood" and that the water and aluminum experiment on which he relied was "not very well designed" with regard to the impact factor.

Bieniosek, on the other hand, stated that a lance or brick falling onto a vapor and water layer in an open hearth furnace would not cause an explosion. According to Bieniosek, not only are impact and turbulence necessary under the circumstances described by Belton, but in addition the water must be trapped between the falling object and the molten metal, rather than traveling behind. In any case, Bieniosek did not believe that falling bricks could penetrate the slag layer due to the highly viscous condition of the slag. Although a falling lance would penetrate the slag layer, Bieniosek believed that water pushed into the molten metal would have ample opportunity to escape around the pipe and into the furnace.

Even if viewed in the light most favorable to the Secretary, it cannot be said that Belton's testimony preponderates over Bieniosek's. At best the two experts' testimony is evenly balanced. Nor does other evidence in the record regarding the accumulation of large quantities of water in the furnaces tend to add weight to either expert's testimony. Several millwrights testified that liquid water can and does accumulate on the surface bath, but the Division Superintendent at Fairless testified that an accumulation of two to three inches is an unusual condition, and that no lance change would be ordered under unusual conditions. He also testified that large amounts of water would not accumulate in the furnace after millwrights go up on the roof because a newly leaking pipe or lance would be turned off at the source. This testimony was never rebutted.

The Secretary also introduced into evidence USS's "Safe Job Procedure for Changing Lances," and its "Safe Job Procedure for Lowering Jets After

Hot Metal Addition." "Safe Job Procedures" are documents drafted by USS purporting to set forth safe procedures for performing various tasks. The "Safe Job Procedure for Changing Lances" provides, among other things, precautionary measures to be taken before and during a molten metal lance change. The precautions include: (1) no lance change during the first 60 minutes after the addition of hot iron to scrap and ore, or thereafter until the bath has been deemed stable by the melter foreman and first helper, (2) no lance change unless all driven fuel has been turned off 20 minutes, and (3) no pit or buggy activity on the charging floor or addition of ore to adjacent furnaces during the procedure. Item 1.4.1 of the "Safe Job Procedure for Lowering Jets After Hot Metal Addition" provides: "If the jet hangs up and causes slack in cable, the sudden drop can cause cable to break and jet will fall free. If hose pinches or breaks water leakage can cause roof damage and water leakage into furnace can cause explosion." The Secretary contended that these two safe job procedures, together with the historical rule against changing lances over molten metal, constitute an admission by USS that molten metal lance changes can cause explosions.

However, one of the millwrights who participated in formulating "Safe Job Procedure for Changing Lances" testified that it was instituted after an employee working over the roof was caught in a crane cable. He also stated that the purpose of the ban on molten metal lance changes was "for nobody to be on top of that roof," but inasmuch as the record establishes that millwrights do go up on the roof to repair door frames, even when there is hot metal in the furnace, we can infer very little

from that statement.[9/] Moreover, the Division Superintendent testified that at the time this Safety Rule was developed, furnaces were constructed of silica, rather than basic brick, and the dangers of roof collapse were considerably greater then. Finally, the "Safe Job Procedure for Changing Lances" makes no mention of an explosion hazard.

The "Safe Job Procedure for Lowering Lances After Addition of Hot Metal," does refer to explosion hazards created by water leaks. However, as indicated earlier, the period immediately after addition of hot iron to the unmelted scrap and ore is known to be a particularly dangerous stage of the heat for reasons not related to water leaks. More importantly, it is clear from the record that the terms "explosion," "violent reaction," and "turbulence" are used interchangeably by millwrights. Consequently, use of the term "explosion" on this Safe Job Procedure does not constitute a concession that entrapment occurs; it may merely refer to a matter not at issue in the case, i.e., turbulence caused by water leaks in the absence of entrapment.

For these reasons we conclude that the record developed below does not demonstrate by a preponderance of the evidence that USS failed to render its workplace free of the alleged hazard of explosions resulting from entrapment of water below molten metal caused by changing oxygen lances

---

9/ The judge found as a matter of fact that "there was an ironclad rule that, once hot metal from the blast furnace had been added to the open hearth furnace, no employees were allowed to go up on the roof superstructure of the open health furnace." However, the record contains uncontradicted testimony that millwrights do go up on furnaces containing molten metal in order to repair door frames.

above a furnace containing molten metal. Accordingly, the citation is vacated.

SO ORDERED.

FOR THE COMMISSION

Ray H. Darling, Jr.

RAY H. DARLING, JR.
EXECUTIVE SECRETARY

DATED: JUN 30 1982

COTTINE, Commissioner, concurring:

I concur in my colleagues' conclusion that the Secretary failed to establish that United States Steel Corporation ("USS") violated section 5(a)(1) of the Act, the "general duty" clause.[1/] However, I adhere to the Commission's view in Bomac Drilling, Div. of TRG Drilling Corp., 81 OSHRC 45/A2, 9 BNA OSHC 1681, 1981 CCH OSHD ¶25,363 (No. 76-450, 1981), and its framework for analyzing alleged section 5(a)(1) violations. Accordingly, I would not overrule Bomac. However, the citation in this case should be vacated because the Secretary failed to establish that the occurrence of an incident was reasonably foreseeable.

I

The analysis in Bomac was based on the Commission's extensive experience in dealing with section 5(a)(1) cases. This experience demonstrated that many section 5(a)(1) citations were issued following specific incidents that led to death or injury in the cited workplaces. In these situations, the parties tended to focus on the specific incidents rather than on the general hazards alleged in the citations. This Commission and reviewing courts repeatedly pointed out that the proper inquiry was whether the general hazard was recognized within the meaning of section 5(a)(1), not whether a particular incident that had resulted in death or injury constituted a violation of section 5(a)(1). See General Dynamics Corp., Quincy Shipbuilding Div. v. OSHRC , 599 F.2d 453 (1st Cir. 1979); Brennan v. Butler Lime and Cement Co., 520 F.2d 1011 (7th Cir. 1975); Brennan v. OSHRC (Vy Lactos Laboratories, Inc.), 494 F.2d 460 (8th Cir. 1974); Western Massachusetts Electric Co., 81 OSAHRC 63/B13, 9 BNA OSHC

---

1/ Section 5(a)(1), 29 U.S.C. §654(a)(1), is quoted at note 2 of the lead opinion.

¶25,470 (No. 76-1174, 1981); Beaird-Poulan, a Div. of Emerson Electric Co., 79 OSAHRC 21/D11, 7 BNA OSHC 1225, 1979 CCH OSHD ¶23,493 (No. 12600, 1979); Boeing Co., Wichita Div., 77 OSAHRC 188/D13, 5 BNA OSHC 2014, 1977-78 CCH OSHD ¶22,266 (No. 12879, 1977). Despite these admonitions, the parties continued to focus on the foreseeability of specific incidents rather than on general hazards in many cases.

In Bomac, as in previous cases,[2/] the Commission stressed that hazards in section 5(a)(1) cases should be defined generically, in order to avoid the tendency to focus on a specific incident. However, inquiring whether the employer recognized the generic hazard does not take into consideration whether the employer had the ability to prevent the occurrence of an incident that could endanger its employees. Because an employer's duty under section 5(a)(1) is an achievable one, a section 5(a)(1) violation can only be found if the employer had the ability to prevent the occurrence of such an incident. See National Realty and Construction Co. v. OSHRC, 489 F.2d 1257, 1266 (D.C. Cir. 1973). If an employer, in the exercise of reasonable diligence, cannot foresee that a hazardous incident will occur, the employer cannot be found in violation of the Act. See General Electric Co., 81 OSAHRC 42/A2, 9 BNA OSHC 1722, 1733, 1981 CCH OSHD ¶25,345 at p. 31,455-5 (No. 13732, 1981) (Cottine, Commissioner, concurring in part and dissenting in part). As stated by the U.S. Court of Appeals for the First Circuit, "An employer is not an insurer and need not take steps to prevent hazards which are not generally foreseeable. . . but at the same time an employer must do all it reasonably can to prevent

---

2/ See, e.g., Brown & Root, Inc., 80 OSAHRC 97/A2, 8 BNA OSHC 2140, 1980 CCH OSHD ¶24,853 (No. 76-1296, 1980).

foreseeable hazards." General Dynamics Corp., 599 F.2d at 458. Therefore, requiring that an incident be reasonably foreseeable is necessary to assure that the employer is not held to a standard of strict liability under section 5(a)(1). See National Realty & Constr. Co. v. OSHRC, supra.

Bomac presents a coherent, integrated approach to the adjudication of section 5(a)(1) cases. The generic definition of hazards assures that the citation and the Secretary's evidence focus on the general hazard the citation seeks to abate, rather than on a specific incident that may or may not be foreseeable. Requiring proof that an incident associated with the generic hazard is reasonably foreseeable assures that the duty imposed on the employer under section 5(a)(1) is achievable.[3/]

II

In this case, the generic hazard is explosions caused by the entrapment of water in molten metal. USS concedes that it recognizes this hazard, and previous cases have shown that the steel industry generally recognizes the hazard. See Babcock & Wilcox Co. v. OSHRC, 622 F.2d 1160, 1164 (3d Cir. 1980); Empire Detroit Steel Div., Detroit Steel Corp. v. OSHRC, 579 F.2d 378, 383 (6th Cir. 1978). Moreover, the worksite was not free of the hazard because of the unavoidable presence of water in USS's open hearth furnaces necessitated by the use of water as a coolant in the steelmaking process. However, the issue tried by the parties was whether an entrapment explosion could foreseeably occur as a result of an oxygen lance change over a furnace containing molten metal. In my opinion, the Secretary failed to prove that this incident was reasonably foreseeable.

---

3/ As the lead opinion points out, the Secretary must also prove that an incident is likely to cause death or serious physical harm and that a feasible means exists to eliminate or materially reduce the hazard in order to establish a section 5(a)(1) violation.

The Secretary's expert witness, Mr. Belton, postulated two methods by which a lance change could result in an entrapment explosion. First, he suggested that the lance itself, which was filled with water, could fall into the furnace, the ports through which water entered and left the lance could become blocked with solidified slag, and the water thereby entrapped could cause the lance to explode. However, USS's expert, Bieniosek, believed slag would not solidify in the water ports because the water would immediately turn to steam when the lance fell into the molten metal and the steam rushing out of the ports would prevent slag from solidifying and water from becoming entrapped. Both experts were well-qualified, but Belton was not personally familiar with USS's furnaces, and his opinion was based on two assumptions not shown to be present. He assumed that the slag depth was eight to twelve inches when it was in fact three to four inches, and he assumed that the ports were one and one-half inches in diameter when they were in fact two inches in diameter. Thus, his opinion was based on the presence of more slag than was actually present and on the belief that it would become solidified in smaller openings than the lances contained. These important variations diminish the weight to be assigned Belton's opinion. Considering the record as a whole, the Secretary has not proven it was reasonably foreseeable that a lance falling into a furnace could lead to an entrapment explosion.

Belton next suggested that if a large quantity of water entered the molten metal bath, as could occur from a leak in the water pipes in the roof, and if a solid object then fell into the bath, the impact of the

solid object could drive some of the water into the molten metal and an explosion could result. However, this type of explosion could only occur if the impact of the falling object is sufficient to entrap water between the molten metal and the falling object, and Belton was uncertain whether a falling brick or lance would have sufficient impact to do this. Bieniosek, on the other hand, was of the opinion that neither bricks falling from the furnace ceiling nor a falling lance could produce the necessary impact. Under these circumstances, I conclude that the Secretary failed to prove that this type of explosion was reasonably foreseeable.

Marc S. Jacobs, Esq.

Brennan, W. E., A.L.J.

STATEMENT OF THE CASE

This case arises under the provisions of Section 10(c)[1/] of the Occupational Safety and Health Act of 1970 (the Act).[2/] There is involved two Items of a Serious Citation, issued pursuant to Section 9(a) of the Act,[3/] by the Secretary of Labor through the Area Director of the Occupational Safety and Health Administration for Philadelphia, Pennsylvania (Complainant), to United States Steel Corporation at its Fairless Hills, Pennsylvania steel plant (Respondent). Penalties of $450 for each Item were proposed by Complainant pursuant to Section 10(a) of the Act.[4/]

On October 20, 1976, in response to employee complaints, Compliance Officers (C.O.) Hrin and Savage of the Philadelphia OSHA office, began an inspection of Respondent's Fairless Hills steel producing plant, specifically the practice of changing oxygen lances in its open hearth furnaces, the basis of the employee complaints. The on site phase of this inspection was substantially completed on October 22, 1976, when C.O. Hrin advised mangement representatives that he was not sufficiently knowledgeable concerning the oxygen lance changing procedure to hold a closing conference and therefore it would not be held until he and C.O. Savage

2/ 29 U.S.C. 651 et seq.

3/ 29 U.S.C. 658(a).

4/ 29 U.S.C. 659(a).

conducted necessary research. (TR. 104-107). Upon completion of this research which was rather prolonged because it was conducted as an additional responsibility to an otherwise full work schedule, (TR. 108-125), a closing conference was held with U. S. Steel's Fairless management on May 4, 1977. On May 6, 1977, the two Itemed Citation for serious violations of the "general duty" clause of the Act,[5/] was issued (R.p. 1), which was contested by Respondent (R.p. 2).

After the pleadings were perfected (R. pp. 4, 6), and pretrial motions ruled upon (R.p. J-1, J-5, J-7, J-14, J-16, J-17, J-18), this case was heard in Philadelphia, Pennsylvania, pursuant to written notices (R.p. J-4, J-22), on September 1 and 2, November 8, 9 and 10, 1977.

Both Complainant and Respondent were represented by counsel, as was Local 4889, United Steelworkers of America, the affected employee representative which had earlier claimed party status. (R.p. J-6, J-15).

The two Items of the Serious Citation allege as follows:

Item No. 1

> A safe and healthful workplace free of recognized hazards likely to cause death or serious physical harm is not provided to employees in the open hearth in that employees are required to change oxygen lances atop the furnaces with molten metal in the furnaces. This process involves hazards associated with water becoming entrapped below molten metal:
>
> a) Open Hearth, furnace #3[6/]

---

[5/] Section 5(a)(1) of the Act, 29 U.S.C. 654(a)(1), which provides that;

> Each employer-
>
> (1) shall furnish to each of his employees employment and a place of employment which are free from recognized hazards that are causing or are likely to cause death or serious physical harm to his employees;

[6/] Complainant's Motion to amend each Item to allege the existence of the violations at all of Respondent's nine open hearth furnaces rather than just furnace #3, (R.p. J-14), was granted prior to trial by written Order (R.p. J-17).

Item No. 2

A safe and healthful workplace free of recognized hazards likely to cause death or serious physical harm is not provided to employees in the open hearth in that employees involved in changing oxygen lances atop the furnaces, if knocked off balance can land on the roof of the furnace and suffer serious burns:

a) Open Hearth, furnace #3[7]

Immediate abatement as to both Items was ordered.

ISSUES

1. Does the practice of changing oxygen lances after the addition of molten metal to its open hearth furnaces, as followed at the Fairless works, expose Respondent's employees to any recognized hazards which are likely to cause death or serious physical harm?

2. Does the process of changing oxygen lances, during regular furnace maintenance, as carried out at the Fairless works, expose millwrights to the dangers of falls onto the top of furnace roofs?

For the reasons which follow, these issues are answered in the affirmative.

STIPULATIONS

United States Steel Corporation is a Delaware corporation with its principal office located in Pittsburgh, Pennsylvania. It acknowledges that it is engaged, as the largest domestic steel producer in the United States, in a business affecting commerce. It has an average number of some 167,000 employees, [employed at various locations, one of which

[7] See footnote 6, supra.

being located at Fairless Hills, Pennsylvania], and had gross 1976 sales of approximately nine billion dollars. Exhibit C-1 reflects some facts concerning the history of prior OSHA inspections and Citations involving the Fairless works. (TR. 7-9).

Additionally, the parties stipulated, at the opening of the trial:

> "... that if water is entrapped by hot or molten metal in a furnace, that an explosion may result and that this is a hazard that is recognized by the steel industry. However, United States Steel will not stipulate that the procedure of changing jet lances while there is hot metal in the furnace will cause this condition to result." (TR. 6).

There was thus drawn, a rather narrow question, namely will the oxygen lance changing procedure as followed at the Fairless works, done after hot metal is added to the furnaces, result in entrapping water in the molten metal within the furnace, thereby creating an explosion? Complainant's evidence, in major part, was aimed at establishing this possibility whereas Respondent's evidence was directed to showing no such realistic possibility exists.

However, the answer to the legal issues posed in this case, as set forth supra under "Issues", can not be determined by answering the more narrow question attempted to be framed by the parties in their stipulation. An evaluation of all of the evidence of this record, (which raises the legal issues as framed, supra) mandates the affirmative answers to these legal issues.

## BACKGROUND

The following background information, as established by the evidence of this record, is helpful to an understanding of this case.

There has been operated at the Fairless works over the years, a number (not less than 9 as of 1976) of "open hearth" furnaces used to produce various types of steel.

These "open hearth" furnaces range from 60 to 90 feet long and from 14 to 20 feet wide, resembling a very large bath tub. The brick or hearth portion are relatively shallow, measuring approximately 20 to 22 feet in their interior. As a total unit, they are massive structures resting upon very large, steel sub-structures. (Exh. C-18). The hearth of the furnace is constructed of refractory brick, a type of heat resistent brick. Its brick bottom is saucer shaped and its verticle sides are covered with a domed, brick roof. This brick structure is built within a large network of large steel beams - called "binders" and frames, which support and bind together the interior brick hearth. Some of these binding steel members and frames, as well as other steel components of these furnaces, are water cooled to prevent their destruction because of the extreme heat necessary to produce steel. On the front of these furnaces are numerous large, water cooled steel doors (weighing approximately one ton each), through which the raw materials are inserted into the furnace, a process known as "charging" the furnace. The brick roofs of these furnaces are supported by a network of large steel "binders", smaller steel "I" beams, and steel rods. On top of the face of the furnace, above the charging doors, is located a water "header", one main source for the distribution and flow control of the water used to cool the various steel components of the furnace.

The brick inner lining of these furnaces, which are subjected to enormous heat, from 2,000° to 3,000°F, are burned thin during a "campaign".

A "campaign" consists of approximately 500 "heats" and takes about six months to complete. A "heat" consists of producing one furnace load of steel, from the addition of the raw material to the "tapping" off (drawing off) of the fully smelted steel. At the end of each "campaign", the furnace is shut down and its inner brick lining rebuilt and other repairs made. Upon being rebuilt, the furnace is then launched upon its next "campaign", the first step of which is to heat the furnace, by burning various types of fuels. Then the following steps are taken.

1. The furnace is prepared for the next "heat". Dolomite (a highly heat resistant substance) is first injected onto the floor with an electrically driven dolomite gun to preserve the furnace bottom. The interior brick surfaces are checked for cracks or other damage.

2. The "charging" of the furnace is then begun. A predetermined amount of limestone is next placed on the bottom of the furnace, on top of the dolomite, both as an ingredient of the steel to be made and as additional insulation for the furnace bottom. At this point the inside temperature of the furnace ranges from 2,000° to 2,900°F, depending upon whether this is the first "heat" of the campaign, or a subsequent "heat". If a subsequent "heat", the interior temperature is in the high range because the prior "heat" has just been "tapped" off.

3. There is then added a predetermined amount of iron ore.

4. There is then added scrap iron. The "charging" of the furnace with the limestone, iron ore and scrap iron, is accomplished by using "charging" machines brought to the doors of the furnace by railroad buggies.

5. After this "charging" is accomplished, the furnace doors are "banked" - a process by which dolomite dams are built up on the inside of the furnace doors.

6. At this point, any required maintenance of the furnace is done, such as changing doors, oxygen lances, frames, etc. After this maintenance is completed, -

7. The last scheduled addition is "hot metal". This is molten steel, brought from a blast furnace and added to the furnace using a huge, 150 ton capacity ladle. (Photograph Exhibit C-3, shows this step of the process). This step is particularly hazardous and recognized as such by all steel men. Danger signs are placed on the "charging" floor in front of the furnace and all employees, except the First Helper who directs the pouring of the hot metal from the ladle by signals to the crane operator, must stay some 40 feet back away from the face of the furnace behind a "charging" rail. With the addition of the hot metal, the bath becomes particularly "unstable", that is, it boils and reacts violently. This unstable, reacting condition can last up to just before the finished steel is tapped off the furnace, from 1 to 1-1/2 hours, and employees are directed to stay clear of the front of the furnace. The furnaces are normally run constantly, seven days a week, "tap" to "tap", through approximately 500 "heats" which constitutes one "campaign". The furnaces, are "fired", i.e., heated by burning various fuels such as natural gas, oil, etc. They also have various vents and flues for carrying off unwanted gases. (See Exh. C-18).

Sometime in the late 1950's, (1956, 1957 or 1958), the practice of using oxygen lances began at the Fairless works.

These oxygen lances, also called "jets", are essentially two steel pipes each encased in an outer steel pipe. At the lance center is a steel pipe through which is pumped oxygen to a copper/alloy "head" or tip at a minimum pressure of 150 pounds per square inch (p.s.i.). The inner oxygen pipe is encased in a larger pipe through which cooling water runs. The two inner pipes are encased in a third, outer steel pipe into which cooling water is pumped at about 40 p.s.i., about 250 gallons per minute. This water is discharged through the second water pipe. The oxygen and water are pumped into and, as to the water, away from the lance, through large flexible hoses at the top of the lance. (Exh. C-19, C-4).

Each lance is about 16 feet long, 6-5/8 inches in outside diameter and weighs 820 pounds when empty. It is designed to hold about 151 pounds of water, approximately 18 gallons, when operating. Thus, when in operation the lance weighs almost one half ton (971 pounds).

The intended use of these lances, at the Fairless works, is for them to be inserted through holes in the furnace roof. Each lance hole is about 11 inches in diameter and its circumference is ringed with a water cooled "doughnut", i.e., a collar through which water is pumped at 40 p.s.i. to assist in shielding the lance from the intense heat within the furnace.

The lance is inserted through the "doughnut" into the interior of the furnace, usually right after the scrap iron has been "charged." The oxygen being pumped through this lance aids in increasing the heat within the furnace and consequently the speed and efficiency of the smelting process.

After the hot metal is added, the intended position of the lance is that its tip, should be inserted through the layer of slag,[8/] which because of its lighter density floats on top of the molten steel, to the interface of the slag and molten steel. In this position, the oxygen being pumped through the lance assists in reducing the time necessary to produce the desired steel.

Each furnace at Fairless is equipped with not less than two nor more than three of these lances. Because of the nature of the smelting process, these lances are subject to two types of malfunctions. First, the lance tips are sometimes rendered inoperative because the oxygen holes become plugged or the tips are damaged. This damage is caused, in major part, when the lance is first lowered into the furnace and inadvertently strikes unmelted scrap iron. The employee responsible for lowering the lance is called the First Helper. He is directly responsible for running the furnace and is paid on an incentive basis as opposed to an hourly wage, under which, the more "heats" his furnace produces, the bigger his pay check. He lowers the lance by looking through an inspection hole (wicket hole) in the furnace door. The practice is to lower the lance rather close to the scrap iron and melt a "puddle" of the scrap directly below the lance, thus forming the spot in the mass into which the lance will be

---

[8/] Slag is a rather complex, molten product consisting of various impurities and other elements produced by the smelting process. The level of the slag within the furnace is kept at a relatively constant thickness, of 3 to 4 inches on top of the molten steel, by having it drain off through one or more of the furnace doors through a "dolomite" dam type of arrangement. The "bath" within the furnace, i.e., the molten steel being processed, is from 3 to 4 feet deep under the layer of slag.

further lowered to the interface of the slag and molten metal after the addition of hot metal. Judging the exact level to which the lance must be lowered after the scrap iron is added, is difficult due to visual distortions within the furnace caused by the intense heat, i.e., "heat waves". Additionally, it is not uncommon that when the lance is so positioned, the oxygen causes the rapid melting of the bases of piles of scrap iron, causing the piles to fall over, striking and damaging the lower tip, or body of the lance.[9/]

Secondly, the lances are subject to malfunctions causing water leaks. Any mechanical breakdown of the water tight integrity of the outer shell of the lance, allows water, at 40 p.s.i., to escape until the water source is turned off. These breakdowns occur because of undetected defective welds in the lance, or when the lance head burns off the lance. Any mechanical failure of the water components of the lance, for any reason, results in water leaking from the lance.

The evidence establishes that the normal "heat" time for a furnace with one to three lances operating properly is about 6 hours. That time is approximately doubled, to about 12 hours, in a furnace without any lances operating.

The malfunctioning of lances has been a common occurrence at Fairless. From their introduction in the 1950's up to some unspecified time in 1975, when a lance malfunctioned, the accepted practice was to elevate it well above the slag surface and turn off both the oxygen and

---

[9/] The experience and therefore skill of First Helpers naturally varies. Thus the frequency of this type of damage to the lance varies.

water. Then the oxygen flow was increased in the still functional second (or third) lance within that furnace and the "heat" continued to "tap" time. If the last functioning lance within a furnace malfunctioned, it too was rendered inoperative and the "heat" continued for the longer period of time made necessary by no operating lances. This procedure was ridgedly adhered to because there was an ironclad rule that, once hot metal from the blast furnaces had been added to the open hearth furnaces, no employees were allowed to go up on the roof superstructure of the open hearth furnaces.

Under this twenty year long procedure, inoperative or leaking lances were changed only after the finished steel had been tapped off the furnace, during the furnace maintenance step of the "charging" cycle, but before any hot metal was added to the furnace.[10/]

## LANCE CHANGE

The process of changing a lance involves four millwright employees. One remains on the "charging" floor in front of the furnace and is referred to as the "ground man". He is responsible for turning off the water to the lance by shuting a gate valve located on the front of the furnace structure, some 7 to 9 feet above that floor level. He also removes the "choker" cable from the old lance, once it is brought to the charging floor by an overhead crane, and reconnects this "choker" cable

---

10/ At this point, the rate of "firing" i.e., heating of the furnace is reduced, and the vents and exhaust flues for the furnace are operating. Thus the ambient temperature above the furnace - in the range of 120°F to 140°F, is less than at the stage after the hot metal is added to the furnace.

to the new (reconditioned) lance which is craned up to the furnace roof. Further, he transfers an oxygen fitting from the old to the reconditioned lance.

One millwright, referred to as the "roofman", is positioned on a steel, grated catwalk atop the furnace. This catwalk is permanently afixed to the top of the large steel "binders", the biggest steel beams supporting the brick roof of the furnace, and is approximately 3-1/2 to 4 feet above the brick roof. This catwalk is equipped with a two-cabled railing along one side. (See Exh. C-7, photograph 3). Because of the lack of clearance from the top of these cables to overhead building structures, these two cables are routinely disconnected and laid on the catwalk during a lance change to provide needed clearance for movement of the lances off and on to the top of the furnace.

Once a nonfunctioning lance is raised out of the furnace, the roofman "pitches", i.e., throws a temporary lid over the lance hole to cover it. If he should miss the hole, or the temporary lid needs adjustment to completely cover the lance hole, the roofman then leaves the catwalk and steps down onto the large steel "binder". (Shown in photograph number 2, Exhibit C-7). From there, he steps further downward to a smaller, (six inch wide) steel "I" beam, part of the supporting roof structure, until he can reach and adjust the lid properly over the lance hole, using a broom handle or any other available object. At this point, marked with a "X" on photograph number 4, Exhibit C-7, the roofman is only 4 to 6 inches above the brick roof of the furnace.

All horizontal surfaces on top of these furnaces, including the brick furnace roof itself, are covered with graphite, a recognized dry

lubricant. When the hot metal leaves the blast furnace, graphite (in powdered or fine granulate form) is spread on the top of the hot metal to conserve its heat during transport to the open hearth furnaces. When the hot metal is poured from the giant ladle into the open hearth furnaces, the graphite becomes air borne and settles onto all horizontal surfaces. The grey, sparkling material shown in photographs numbered 2, 3 and 4 of Exhibit C-7 is this graphite. The roofman is instructed to sweep this graphite off the large "binder" before he steps onto it from the catwalk. (Exhibit C-2, paragraph 2.3).

Once a reconditioned lance is ready to be inserted into the furnace, the roofman again leaves the catwalk, steps onto the "binder", which is 18 inches above the brick roof, and manually guides the lance through the "doughnut" into the lance hole in the furnace roof. Photograph number 2 of Exhibit C-7 shows this procedure. However, the task of the roofman may, on occasion, involve considerable movement and require considerable leverage, to align the reconditioned lance properly with the "doughnut" and lance hole. These water cooled "doughnuts", constructed by Respondent's masons during furnace reconditioning at the end of a campaign, are either not properly aligned over the lance hole when built, or the "doughnut" may shift out of proper alignment, due to the intense and prolonged heat during a "campaign". (See Photographs numbered 1, 2 and 3, Exhibit C-9 which show flames shooting out of the "doughnut" holes with oxygen lances in place and operating). This misalignment has been so severe that roofmen have had to use shovels to pry and force reconditioned lances through misaligned lance holes. Additionally, when malfunctioning lances are craned off the furnace roof, they are suspended from the traveling crane

by one cable called a "choker" cable. If the "choker" cable is not wrapped around the old lance at or near its proper balance point, the lance will not assume the necessary angle from the verticle to allow it to be moved off the roof without striking the lower catwalk, water pipes located on the furnace roof or the main water "header" atop the face of the furnace. The proper angle is necessary because of limited clearances between the furnace superstructures and structural members of the building's roof above. When this situation arises, the roofman must manhandle the lance over the catwalk. Further, if the "choker" cable is placed around the lance at a seriously out of balance position, the off-balance movement of the lance can be extreme, end-over-end, an action aptly called "helicoptering" by the millwrights. The amount of movement and agility required by the roofman, under these varying conditions, is in part depicted in photographs numbered 1 and 2 of Exhibit C-6.[11/]

The two other millwrights involved in a lance change are stationed on an upper steel catwalk, some 15 feet above the furnace roof. The beginning of the lance change involves raising the lance by its own lifting cable out of the furnace to a certain level at which the lance safety chain[12/] is removed so that the oxygen and water hoses may be disconnected. At this point, the lance is suspended only by its own lifting cable, a cable which the millwright witnesses testified to having seen break on a number of occasions. Next the lance is further elevated

---

[11/] All photographic exhibits were taken by the compliance officers during their October, 1976 inspection at the Fairless works.

[12/] The safety chain is on the lance to prevent the lance from falling into the furnace if the lance hoisting cable breaks or malfunctions.

by its own hoisting cable to a higher level, at which point, the oxygen and water hoses are disconnected by the use of a hammer. The disconnected hoses are draped over the railings of this upper catwalk. (See photographs numbered 1 and 2, Exhibit C-5, photograph 3, Exhibit C-6). Then a large traveling crane hook and its block is signaled into place by the upper catwalk millwrights. The crane operator is located in the crane cab, at approximately the same level as the upper catwalk but some 70 feet away from the catwalk. A "choker" cable is then wrapped around the lance and the crane takes a strain on this cable. The lance is then lowered by the crane, upon signal by the millwright, to a point where the millwrights can remove the lance "lifting yoke" or "bale", a "U" shaped bridle by which the lance lifting cable is attached to the lance. (See Photograph 3, Exhibit C-4). The upper catwalk millwrights then signal the craneman to take the old lance off the furnace roof. This involves rather skilled crane operation because of hoisting limitations of the crane itself as well as clearance limitations between the lower catwalk, the main water header and building roof structures. Under normal conditions, the transiting lances clear the lower catwalk by about 3 inches and the water header by about 6 inches. The millwright witnesses testified to having seen lances in transit strike and damage both the lower catwalk and water header. When the water header has been damaged, water poured out in large volume, running down the face of and into the furnace. On these occasions, no hot metal had as yet been added to the furnaces. The old lance is then deposited by the crane on the furnace charging floor, the "choker" cable switched from the old lance to the reconditioned lance and

the oxygen fitting changed by the "ground man". The new lance is then craned to the furnace top, connected to its own hoisting cable, and the oxygen and water hoses connected and safety chain affixed. The "choker" cable is removed (by the roofman, again standing on a "binder") and the crane hook and block clears the area. Water into the new lance is then turned on, the lance is checked for leaks and then lowered through the "doughnut" hole into the furnace. The millwrights then leave the top of the furnace. At this point the First Helper on the charging floor takes control of the newly inserted lance. Oxygen is turned on, and the lance, being observed and controlled by the First Helper, is checked for proper operation and lowered to the desired level.

If no unforeseen problems arise, the changing of a lance takes approximately twenty minutes. Speedy work is a necessity because of the extremely high temperatures on the furnace roof. Millwright Joseph Vandergrift testified to having "passed out" doing lance changes and to having the hair in his nose and his legs burned from the ambient heat atop these furnaces. These episodes are significant as they occurred during the normal lance changing procedure at Fairless, before hot metal was added to the furnace. At that point, the ambient temperature above the furnaces is lower (the evidence does not reveal how much) than after the hot metal, (at close to 2,800°F) is added.

As mentioned previously, this lance changing procedure, done during the maintenance step of "charging" before hot metal was added to the furnace, has been followed for approximately twenty years at the Fairless works. (See copy of a Memorandum of Procedure issued by Respondent on June 2, 1956, Exhibit C-10. This Exhibit, illegible as C-10, is

reproduced at page 3, Exhibit C-11, an Arbitration Award, issued on December 28, 1976. The third numbered provision of the 1956 Memorandum, provides, "Jet will not be changed after hot metal has been added.").

THE DESIRED NEW LANCE PROCEDURE

In 1975, a newly assigned Superintendent of the open hearth furnaces, a Mr. Thompson,[13/] arrived at the Fairless works from U. S. Steel's Gary, Indiana works. Reportedly a procedure of changing the last operative lance, when it malfunctioned, after hot metal had been added to the furnace, had been followed for many years at the Gary works.[14/]

In May of 1975, the new Superintendent, Mr. Thompson, persuaded the millwrights to make one lance change after hot metal had been added to a furnace, reportedly with the understanding by the millwrights, that they would not be required to do this task again. There is a suggestion in the evidence that the millwrights consession to make this one lance change over hot metal, was in part at least brought about by the following circumstances. The Respondent, in consultation with appropriate union safety committee employees, routinely issues Safe Job Procedures (SJPs) for various job tasks. One such SJP was issued early in 1975, covering, in Part A, the long established procedure of changing lances with no hot metal in the furnace, and in Part B, the newly desired procedure of changing lances after hot metal had been added. The names of the

[13/] Mr. Thompson was not produced as a witness.

[14/] No witness produced by Respondent testified to any necessary details of Respondent's lance changing procedures followed at its Gary works to allow any comparison between the Gary and Fairless procedures.

participating union safety committee representatives, Messrs. Golden and Martino, appear on this SJPs. Thus, the argument was made to the millwrights, (either expressly or by implication) that because the union safety committee members names were on this SJP, it constituted a union safety committee endorsement of the Part B section of the SJP (lance change after hot metal added), and thus, an agreed upon safe procedure.

However, Mr. Martino testified (TR. 439-455) that both he and Mr. Golden participated in drafting only Part A of this SJP, (Exhibit C-2), but declined to assist in drafting Part B, both believing that it was not safe to change lances after hot metal had been added. Both Mr. Martino and Mr. Golden specifically disagreed with Part B of this SJP and requested the removal of their names from this SJP. Their names, were not removed until after the millwrights had made the one lance change over hot metal. (Exhibit C-15).

At any rate, the millwrights, after making this one lance change over hot metal, thereafter steadfastly refused to do so again, believing that such a procedure subjected them to unnecessary additional risks of serious injury or death, in an admittedly hazardous occupation and environment. Management, upon such refusals, began to discipline the millwrights by sending them off the job with loss of pay.

Thus, under provisions of the collective bargaining agreement at Fairless, the millwrights instituted a grievance procedure which resulted in the issuance, on December 28, 1976, of an Arbitration Award, in their favor. (Exhibit C-11).

Evidently, the lost pay of those millwrights sent home (over 20), prior to the Arbitration Award, was recouped more than a year after the issuance of this Award (TR. 1109).

Since the millwrights refusal to change the lances over hot metal, management personnel have made these changes, when necessary. We are thus brought to a highly significant, and uncontested fact.

The need to change the last functioning lance, after hot metal has been added to the open hearth furnaces, has occurred only from 4 to 7 times in the past two years at Fairless (from 1975 to date of trial, September, 1977). This is quite understandable when it is recalled that each furnace is equipped with either two or three lances. When one malfunctions, it is raised, put out of operation and the oxygen flow in the remaining one or two lances, increased. Thus, the practice of changing a lance over hot metal, which occurs only when all lances in a furnace have malfunctioned, is not a common occurrence.

Additionally, when such an occurrence takes place, i.e., the failure of all lances within a furnace, management has two choices.

First, it may insist on changing one of the lances over hot metal, or secondly, it can continue the "heat" for the necessary additional 6 hours.

Thus, assuming that just one of the nine open hearth furnaces at Fairless is operated for 200 days in one year (165 days of down time for rebuilding at the end of campaigns or for other reasons). On a 24-hour a day operating basis, this furnace will be operating for 4,800 hours in a year. If this one furnace has 7 episodes of total lance failure in one year,[15/] and management chose the second option above, it would mean that

[15/] The evidence reveals that from 4 to 7 total lance failures were experienced, over almost a two year period, in all nine open hearth furnaces operated at Fairless.

7 "heats" (out of approximately 800 "heats" - 4 per 24 hour period times 200 days) would each have to be lengthened by 6 hours. Thus, 42 hours would be added to the year's 4,800 hours of "heat" time, without any loss of the amount of steel produced.

The foregoing calculation, based on the evidence of record, puts this case in its proper perspective and is essential to a reasoned and just determination of the issues raised. In short, it is not inappropriate in this case, indeed it is essential, to balance the possible additional 42 hours of "heat" time in a 200 day-yearly production cycle against those hazards to which the millwrights would be subjected if forced to change lances over hot metal.

## COMPLAINANT'S POSITION

The testimony of eight employees of Respondent, six millwrights with over 110 years of combined open hearth experience, (see testimony of Mr. Vandergrift, TR. 224-383, 1103-1130; Mr. Hormel, TR. 393-437; Mr. Martino, TR. 439-455; Mr. Park, TR. 455-469; Mr. Gregory, TR. 470-484; and Mr. Forney, TR. 992-1024), and First Helper Silvestri with over 36 years' experience (TR. 1037-1196), clearly establish the following.

At the start of a "campaign", the brick roof (referred to as "basic" brick), is about 18 inches thick. These brick consist in part of a "chrome" base, the intended use of which is to fuse the individual bricks together under high heat, as the brick roof is built without mortar. Respondent's Steel Production Superintendent at Fairless, Mr. Krupp, testified that prior to the mid-1950's, the steel industry used a "silica" type brick in its open hearth furnace roofs, which was less durable than

"basic" brick, and thus sometime in 1956 or 1957, the industry changed to "basic" brick. Although the evidence is not precise, it best supports the conclusion that the Fairless works, followed the industry trend and thus changed to "basic" brick construction in the late 1950's. (TR. 620-622).

As more and more "heats" are carried on in a furnace, with interior temperatures ranging from not less than 2,000°F up to close to 3,000°F, the brick roof essentially burns away, that is, its original thickness is gradually reduced to 4 inches or less. As the brick in the furnace roofs become thinner, a point is reached when these brick will glow a cherry red color. At this point, the exterior temperature of the brick is in excess of 1,000°F. As the furnace roof is burned away, it is not uncommon for sections to fall into the interior of the furnace, at unpredictable times, necessitating a patch of the roof holes caused thereby.

The millwright witnesses testified most convincingly that they fear for their lives if made to change oxygen lances after hot metal is added to the furnace, fearing that water may get into the bath and cause an explosion.

An "explosion", as far as this case is concerned, is the rapid conversion of water into steam, under conditions which do not allow the gradual escape of the steam, but rather the confinement therefore until sufficient pressure, i.e., energy, is built up to overcome the confinement, and at that point, the rapid release of the steam, commonly called an explosion. Respondent's witnesses carefully avoided the term "explosion", consistently referring to this phenomena as "eruptions" and/or "violent eruptions".

The long experienced millwrights have witnessed many explosions (or violent eruptions) in the Fairless furnaces with which they have worked. These explosions are caused, by water, in one form or another, becoming entrapped in the bath in these furnaces. The sources of this water, are indeed, numerous. The limestone or iron ore can contain sufficient water, particularly ice particles, to cause such explosions. The bundles of scrap iron too, can contain water, or ice particles which cause explosions. Perhaps the most dangerous source of water in the open hearth furnace operation, is the furnace itself. As alluded to earlier, these massive structures consist in major part of a steel framework of water cooled supporting and binding members, which hold the brick, inner portion of the furnace together. Various steel frames in the sides, back and front of these furnaces are water cooled.[16/] The large, one ton doors are water cooled. The lance collar or "doughnut" is water cooled. Thus, to a highly significant degree, part of the furnace structure is a system of water pipes which circulate water to these water cooled furnace components. At least one main source for the distribution and control of this water is on the top of the face of the furnace, above the charging doors, the so called "water header". Additionally, numerous pipes are located on top of the furnace as part of this cooling system. Of course, the oxygen lances themselves, being water cooled, and operating within the interior of the furnaces, are an important potential source of interjecting water into the bath.

The millwrights testified to oxygen lances malfunctioning within the furnace when the lance head or tip has burned off, leaking water (under 40

---

16/ The evidence is not too specific on these details.

p.s.i.) into the furnace, and explosions resulting. One such episode caused a large explosion which blew two furnace charging doors off the furnace, (each weighing about one ton), blew off one furnace frame and caused bricks to fly about. They have seen malfunctioning lances, when being craned on top of the furnaces after withdrawal from the furnace interior, slip within the "choker" cable, striking and rupturing water pipes on top of the furnace, causing water leaks. They have seen the lance hoisting cable break, when lifting a malfunctioning lance out of the furnace. On at least one occasion, when the lance was being transported by the crane, the "choker" cable broke and the lance went through the furnace roof. There have been not less than 6 or 7 episodes, (and perhaps many more) in the past eight years, when "choker" cables have broken or lances slipped when being transported by these cables. These episodes took place, before hot metal had been added to the furnace, during the normal lance change period, i.e., the maintenance step as set forth, supra. They have seen the lance hole collar or "doughnut" rupture and leak water - at 40 p.s.i. into the furnace. They have seen lances, during the changing procedure, strike the water header, severely damaging it and rupturing water lines allowing water to run down the face of and into the interior of the furnace. (This accident also occurred before hot metal had been added. No explosion resulted but evidently a large volume of steam was produced which caused "some problems", unexplained in the record.) There was at least one episode when part of the brick roof of a furnace fell in, after hot metal had been added, which caused an explosion. Considerable damage to the furnace resulted, bricks were blown about, and

molten metal was blown out of the furnace, scarring a panel board, some 70 feet from the face of the furnace. Evidently a hole was blown in the brick furnace roof, necessitating patch work after the explosion.

The melting ingredients within these furnaces, are, particularly at certain steps, an inherently unstable commodity. During the heat, or "cook", the melting ingredients bubble and are agitated as the intense heat causes the melting of the ingredients and generation of gases. This instability of the melt is intensified after the hot metal is added to the furnace, as it reacts with the scrap metal and other ingredients within the furnace. If water from any source, should get into this unstable bath, the chances of some of the water becoming entrapped with a resulting explosion, are increased.

The millwrights have known (and seen the results) of explosions which have occurred during the period from the time hot metal has been added up to the time that the furnace is tapped. This period is recognized by Respondent as a particularly dangerous time, as "Danger" signs are posted on the "charging" floors and employees (except for the First Helper who is in charge of the cook) must stay behind a "charging" rail, some 40 feet away from the face of the furnace.

It, understandably, is often times difficult to pinpoint the precise cause of these explosions or "violent eruptions", i.e., the source of the water which, basically, causes the explosions, because, when an explosion occurs, the employees are, pursuant to Respondent's policy, away from the furnace, and those nearest these explosions, hurriedly remove themselves from the scene. Sources of such explosions have, in the past, been

established as excessively leaking lances, undetected leaking water cooled frames of the furnace, as well as water moisture in the limestone, iron ore and scrap iron charges. Thus, as a general proposition, an open hearth furnace, at the Fairless works, during a "heat", is an inherently dangerous and partially unpredictable instrument of steel production.[17/]

First Helper Silvestri, with approximately 40 years of this type of experience, testified that on the furnaces under his supervision, he has seen explosions or "blows" caused by leaking lances. Based on his long experience,[18/] he always changes leaking lances at the normal maintenance phase of the "charging" process, before hot metal is added to the furnace.[19/] Lance changes at this time are relatively common, with 50 to 60 such changes per month, on all furnaces, normally being done by the millwrights. If lances malfunction after hot metal is added to his furnace, Mr. Silvestri raises them above the bath and turns off the oxygen and water, because he is afraid of an explosion if the malfunctioning lance were allowed to remain active in the furnace. (TR. 1037-1096).

RESPONDENT'S DEFENSES

Respondent's basic defense, as to both Items of the Serious Citation, is that the hazards involved are not "recognized hazards" within the meaning of Section 5(a)(1) of the Act.

---

17/ The interior of open hearth furnaces with hot metal therein bares some resemblances to the interior of a controlled volcano containing molten lava.

18/ The judgment of the First Helper is subject to being overruled by the "Melter Foreman", his immediate superior and a member of management.

19/ Leaking lances are used in the furnaces, being changed only if the First Helper determines that the lance is leaking so badly that it will not last to the end of the heat.

Item No. 1

As to this Item, Respondent argues that the evidence of record fails to show that changing oxygen lances, after hot metal is added to the furnaces, is a hazard, "recognized" by either U. S. Steel, or the steel making industry generally. Thus this Item must be dismissed.

The evidence of record, considered as a whole, does not support this position.

The strongest evidence that changing oxygen lances over hot metal, at the Fairless works is hazardous, is the totally convincing testimony of the millwright employees, with combined work experience in and around Respondent's furnaces of well over 100 years. This testimony, of explosions occurring, for numerous reasons, at all stages of the "heat" process, including after hot metal had been added to the furnaces, is not rebutted in this record. Such employee recognition of a hazard, based on their day-to-day involvement with the steel making process, over so many years, can not be discounted. It supplies that objective proof of the "recognized" character of hazards, which the cases cited by Respondent in brief speak to.

Indeed, from 1956 to 1975, U. S. Steel itself clearly recognized that changing lances after hot metal had been added to the furnaces was hazardous - and, specifically forbid the practice at Fairless. (Exhibits C-10, C-11; "3. Jet [lances] will not be changed after hot metal has been added.").

Further, as late as February 28, 1975, U. S. Steel, in its "Safe Job Procedure" (SJP) for "Lowering Jets After Hot Metal Addition"

clearly recognized the dangerous possibility of explosion during this procedure. Paragraph 1.4.1 of this SJP reads:

> 1.4.1 If the jet hangs up and causes slack in cable, the sudden drop can cause cable to break and jet will fall free. If hose pinches or breaks water leakage can cause roof damage and water leakage into furnace can cause explosion.
>
> (Exhibit C-12)

It was not until the arrival of Messers. Thompson and Krupp (Management supervision from another U. S. Steel plant), that the long accepted, and <u>enforced</u> procedure of <u>not</u> changing lances after hot metal addition was sought to be changed. The only reason for this change, as far as the evidence of this record reveals, was to avoid prolonging the 4 to 5 "heats" per year (for all nine furnaces) for the added 6 hours per "heat" with no lances operating. In short, the reason was strictly economic, and the economic loss to Respondent, for the 4 or 5 twelve hour long "heats" as compared to these 4 or 5 "heats" taking six hours was indeed, quite insignificant. The insignificance of such an economic loss, (for a company which in 1976 had gross sales of approximately nine billion dollars) fades into total insignificance when measured against the realistic possibility of an explosion occurring after hot metal had been added to a furnace, and the grave consequences to the millwrights, atop the furnace making a lance change. The adamant refusal of the millwrights to engage in this type of a poker game, with their own lives as the stake, is not only understandable, but commendable.

The testimony of Respondent's management witness, Mr. Krupp, that the practice complained of is not hazardous, is extremely unpersuasive.

He is not obligated, (under the threat of being sent home without pay - as were the millwrights) to routinely engage in this practice. As Respondent's Division Superintendent for Steel Production at Fairless, he was one of two management men who, after his arrival at Fairless in 1975, sought to change a twenty year practice. His stated opinion that this new practice was not hazardous, is understandable, but worthy of no weight.

Respondent's argument that changing lances after hot metal has been added to furnaces, is not a "recognized" hazard but "the usual practice in the steel industry", is equally unconvincing on the evidence of this record. (Respondent's Brief, p. 6).

Respondent relies on the testimony of Mr. Krupp that oxygen lances were changed with hot metal in the furnaces at other plants of U. S. Steel, at a Canadian plant (Stelco Corp.) and at Bethlehem's Sparrows Point steel plant. However, a close examination of this testimony (TR. 584-727) immediately reveals a striking lack of any details of the exact procedures followed elsewhere in the industry, i.e., exact placement of millwrights during the procedure, the exact steps followed, the exact equipment used such as cranes, cables, etc., the exact configuration, construction, age, etc., of the furnaces involved, to admit of any realistic comparison between the Fairless procedure and the procedure followed anywhere else. The evidence is so meager that it can not support any conclusion as to what "industry practice" or U. S. Steel practice at sites other than Fairless is regarding the changing of oxygen lances after hot metal has been added to open hearth furnaces.

Respondent argues that Compliance Officer Hriu's research concerning this practice resulted in his finding that Bethlehem's Sparrows Point

plant does change lances over hot metal. Thus, this discovery establishes this procedure as an "industry practice". This argument is also not persuasive for the same reason as stated, supra. No details of Bethlehem's procedure nor furnaces are set forth in this record. Thus, exactly what the "industry practice" may be is not established by the evidence herein.

Furthermore, even assuming that there is an "industry practice" or U. S. Steel practice at plants other than Fairless, of changing oxygen lances after hot metal is added to open hearth furnaces, such a practice may well be as hazardous as the evidence herein proves Respondent's Fairless works procedure to be. In short, the label "industry practice" does not necessarily equate with "hazardous free", or safe practice.

As stated in Cape Vineyard Div. of the New Bedford Gas and Electric Light Co. v. OSHRC, 512 F.2d 1148, 1152, (1st Cir., 1975);

* * *

> We would expect, most often, that reference to industry custom and practice will establish the standard of conduct. There may, however, be instances where industry practice fails to take reasonable precautions against hazards generally known in the industry; in such event it may not be unfair to hold the employer to a standard higher than that of actual practice.

In summary, the overwhelming weight of the evidence of this record establishes that changing oxygen lances, after hot metal has been added to the open hearth furnaces at Respondent's Fairless works, a practice clearly recognized for over 20 years by Respondent as hazardous, and to this date still recognized by the Fairless millwright employees who would actually be obligated to perform the tasks associated therewith, is a "recognized" hazard which is likely to cause death or serious physical harm to Respondent's millwrights, within the meaning of Section 5(a)(1) of the Act.

This case involves more than the very narrow issue of whether a lance, during a change, can fall into a furnace and thereby cause an explosion. This is so because the evidence establishes that explosions occur in open hearth furnaces for reasons other than having a lance fall into a furnace during a lance change. Such explosions have occurred, and can occur, by the entrapment of water in the hot metal from sources completely separate from the lance, such as, a leaking water cooled furnace frame, a leaking "charging" door or damaged and leaking cooling water pipes of numerous types. These occurrences are largely unpredictable, and thus can occur when millwrights would be atop the furnace, changing a lance after hot metal is added to the furnace. The effect of such an occurrence most probably would be death or at least serious physical harm to these millwrights. This issue was specifically tried by the parties during this five day trial, and thus the legal issue presented by this record is broader than initially framed by the parties.

Thus the testimony of the two expert witnesses, Mr. Belton for Complainant (TR. 505-566) and Mr. Bieniosek for Respondent, (TR. 869-970), which related chiefly to the scientific physics of explosions as they might be caused by an oxygen lance falling into a furnace after the addition of hot metal, is not determinative of the broader legal issue presented, and fully tried, in this case.

Item No. 2

Respondent basically interjects the same defense to this Item as to Item No. 1, that the evidence does not establish that having the roofman millwright leave the furnace roof catwalk, stepping down onto binders,

or below, in order to guide lances into the water cooled roof hole, is a "recognized" hazard within the meaning of Section 5(a)(1). Respondent argues that Complainant, "... has been engaged in the business of making a mountain out of the molehill." (Respondent's Brief, p. 13).

Although less evidence was introduced by the parties as to Item No. 2 as compared to Item No. 1, the evidence does establish that the practice of allowing millwrights to leave the furnace roof catwalk and go down onto the large binders, and below onto smaller "I" beams, to not only guide lances into the "doughnut" holes, but to adjust the temporary cover placed over the lance hole, is a recognized hazard that can cause death or serious physical harm.

The evidence is clear, that from 50 to 60 oxygen lance changes per month, in all the furnaces, are routinely made during the normal, maintenance step of the charging procedure, before any hot metal is added to the furnace. During this maintenance step, the fires of the furnaces are reduced, and exhaust vents and flues are fully operating, venting some of the massive heat (and gases such as carbon monoxide), from within the furnaces. However, the interior furnace temperatures do not go below 2,000°F, and the ambient temperatures on the furnace roofs are extremely high, 140°F or higher. Depending on how "old" the brick roof is, and thus the thickness of the brick, the external temperature of this brick evidently vary from very hot to cherry red. (The evidence is rather meager as to external brick temperatures). However, the evidence does establish, by the direct testimony of millwright Vandergrift, (TR. 224-390; 1103-1128), who routinely changes oxygen lances during the maintenance step, that the heat

is so extreme on the furnace roofs during this procedure that he has become unconscious, he has had his normal work pants ignite from the heat, has burned his legs and thus must wear long underwear year around, and he and other millwrights have seen 2" x 12" planks - left on the roofs by masons who had repaired furnace holes,[20/] ignite and burn because of the heat on the furnace roofs.

Sometime in 1972, the millwrights were supplied with jackets and pants made of yellow heat resistant material (Exhibit C-14 is a patch of this material). However, this heat resistant cloth is not "fireproof", as it will burn when exposed to flame, and will also ignite from extreme temperature. One worker (Tom Johnson) while wearing pants of this heat resistant cloth, had his legs burned in 1976, when the cloth ignited because of extreme heat. (TR. 268-275). Millwright Hormel testified (TR. 393-437) to having been told that the external temperature of "red" brick in the furnace roofs is in the neighborhood of 1,200°F. Additionally, he testified that while wearing a jacket of this flame retardant cloth, he accidently backed into a steam pipe and was burned. Thus, it is apparent, that if a millwright were to slip or be knocked to the cherry red bricks of a furnace roof, severe burns, shock and very probably death could result.

As to the likelihood of slipping or being knocked off onto the furnace roof, the evidence is overwhelming.

---

[20/] The masons, while repairing burned out and collapsed holes in the brick roof tops, normally wet down the planks they use as scaffold boards to prevent their ignition.

As alluded to earlier, all horizontal surfaces, including the catwalks, binders, "I" beams and the furnace roof itself, are covered with heavy layers of graphite. This condition is readily apparent in the photographs of Exhibit C-7. Graphite is a recognized dry lubricant. Although the millwrights are instructed to sweep the graphite off the large binder before going upon it, (Exhibit C-2, paragraph 2.3), no such instruction is given as to the smaller "I" beams, onto which millwrights step to adjust the temporary lance hole cover. The slipping hazard, of course, is accentuated when, depending upon the height of the millwright performing the "roofman's" task, he may lean out beyond the binder to grasp a lance, or to strenuously shove the lance into proper alignment to be inserted through the "doughnut" hole in the furnace roof. Both hands must be used for this task leaving the millwright with a reduced chance of saving himself from a fall in the event of slipping on residual graphite on the binder.

The possibility of being knocked off the binder, is established in this record. When lances malfunction, it is not uncommon that a knob or ball of solidified steel anneals itself to the lance tip. Before the lance can be withdrawn through the lance hole, this knob must be burned off. Thus the lance is lowered into the bath and varying lengths of the lance are melted away. Thus when the lance is finally removed from the furnace, its length will differ from the normal 16 feet. Then, when the crane choker cable is attached, and the lances lifting cable and safety chain is removed, the lance can swing end over end if the choker cable is not affixed at the proper balance point, the "helicopter" action seen by

millwrights during lance changes. If this lance, weighing many hundreds of pounds, should strike a millwright, he may be knocked onto the furnace roof. Further, in inserting reconditioned lances into the lance hole, considerable force is exerted to properly align the lance for insertion, made necessary, in varying degrees, by possible misalignment of the "doughnut" water cooler and furnace roof hole. This task is done by the millwright while standing on the binder, 18 inches above the brick furnace roof.

Due to restricted clearances, the damaged lance being craned off the furnace roof, must be guided and manhandled, over the roof catwalk by the roofman. (See Exhibit C-6, Photograph 1). (This catwalk has been "torn up" by a lance striking it during a lance change). If this lance should slip within the choker cable, or the choker cable break at this point, (both types of occurrences have happened in the past), there is a high possibility that the millwright might be knocked off the catwalk onto the furnace roof.

After the large oxygen and water hoses have been disconnected from the lance, they are draped over the upper catwalk railing. (See photographs 3 and 4, Exhibit C-6; photograph 1, Exhibit C-5). If the lance should accidently strike and dislodge these hoses, because of choker cable slippage or breakage, the large hoses with heavy metal "knock" fittings, could be dislodged and strike the roofman below, knocking him onto the furnace roof.

Thus, the evidence establishes numerous realistic and potential causes of the roofman either slipping or being knocked off balance, while

working either on the roof catwalk, or the large binder, and the possibility of his landing on the extremely hot brick furnace roof.

That such hazards, at least before the trial of this case, were recognized by Respondent is demonstrated by its Safe Job Procedure dated July 21, 1975, Exhibit C-2. The following paragraphs are illustrative of the "Hazards" so recognized:

2.3.1 Loss of balance while sweeping binder

2.3.2 Be alert to dust & graphite in eyes when sweeping binder

2.4.1 Loss of balance

2.4.2 Tripping hazard - tools or debris on roof

3.2.1 Struck by hammer [used to strike "knock" joints to disconnect oxygen and water hoses]

3.2.2 Slipping hazards

3.3.2 Struck by lance

3.5.1 Struck by crane block

5.3.2 Do not reach out for lance. Call roofman to to assist. Do not over extend your reach.

5.6.1 Slipping hazard - dust accumulated on binder

8.1.1 Slipping hazard - dust on binder

9.1.1 Struck by tools or materials

In my view, this 1975 statement by Respondent at its Fairless works of some, (but not all), of the "Hazards" associated with the roofman's duties in changing lances atop the furnaces is adequate in itself to establish the "recognized" character of these hazards by this Respondent.

Additionally, a thorough evaluation of all of the evidence of this record, as to both Items of the Citation, clearly establish that both practices alleged to be hazardous are patently dangerous to the millwrights charged with carrying out these tasks.

As recently noted by the Review Commission in Sec. of Labor v. Schriber Sheet Metal & Roofers, Inc., OSHRC Docket Nos. 15681, 15927 & 76-02 (1977)

> ".... even without evidence of industry recognition, certain conditions are so patently dangerous that they must be classified as a recognized hazard and are within the scope of section 5(a)(1)." (Slip opinion, p. 5, citing Usery, Sec. of Labor v. Marquette Cement Manufacturing Co., _____ F.2d _____ (2nd. Cir., No. 76-4083, 1977).

It is therefore concluded, that Respondent's defense to both Items of the Citation, i.e., the lack of "recognition" of the hazards complained of at its Fairless works, is not supported by either the law or facts. It is therefore rejected.

Respondent's last defense is that the record herein does not establish that accidents and injuries have occurred because of the practices set forth in both Items, and thus no violations have been established.

It has long been held that the likelihood of an accident occurring, or indeed the occurrence of an accident, is not essential to the proof of a violation of the Act. Rather the question is whether there is a substantial probability that death or serious physical harm would occur in the event an accident occurred. The probability of an accident occurring is relevant only to the gravity of the violation. See National Realty and Construction Co., Inc. v. OSHRC & Sec. of Labor, 489 F.2d 1257, 1267,

(C.A.D.C., 1973); California Stevedore & Ballast Co. v. OSHRC, 517 F.2d 986, 988 (9th Cir., 1975); Sec. of Labor v. Coastal Pile Driving, Inc., OSHRC Dkt. No. 14458 (1977); Sec. of Labor v. Vecco Concrete Construction, Inc., OSHRC Dkt. No. 15579 (1977).

The evidence here clearly establishes a substantial probability that death or serious physical harm will occur to the Fairless millwrights, under either practice set forth in Items 1 or 2, in the event of accident. The probability of an accident occurring under Item 1, changing lances after hot metal addition to the furnaces, because of the unpredictability of explosions, "eruptions", "blows", partial roof collapses, and malfunctioning cables used to lift and transport the lances, is high. The probability of an accident occurring under Item 2, is perhaps less than under Item 1, but nevertheless very real. The absence of such recorded accidents in the past is due more to the agility, strength and caution of the millwrights engaged in lance changes rather than the lack of dangers associated therewith.

This defense of Respondent's is not supported in law or by the evidence of this record.

One last item need be mentioned for a resolution of the issues herein.

> To assure that citations issue only upon careful deliberation, the Secretary must be constrained to specify the particular steps a cited employer should have taken to avoid citation, and to demonstrate the feasibility and likely utility of these measures.
>
> National Realty & Construction Co., Inc. v. OSHRC & Sec. of Labor, supra, at 1268.

In short, what could have been done by this Respondent to avoid this Citation?

Item No. 1

The Complainant's witnesses, C. O. Hrin, millwright Vandergrift, and long experienced First Helper Silvestri, ambly supplied the required evidence. Indeed, the solution to the dangerous practice of changing oxygen lances after hot metal is added to the furnaces, is obviously, not to do it. That is, to return to Respondent's pre-1975 practice - a practice followed for over the preceding two decades. In fact, the precise practice currently followed by its long experienced First Helper Silvestri. When the last functioning lance malfunctions he raises it above the melt, totally deactivates it and continues the melt for the necessary added time, not more than 6 hours, depending on when during the "heat", the last lance is rendered inoperative. Because this situation occurs only from 4 to 5 times within one year, as to all of Respondent's operating furnaces, the added production time (24 to 30 hours per year) and expense must be considered totally insignificant when weighed against the risk to the millwrights, involved in this procedure (3 millwrights per lance change, atop the furnace for each episode with exposure lasting for not less than 20 minutes).

Item No. 2

As to the common practice of lance changes before hot metal is added, during the normal maintenance step, the millwright who is really exposed to danger is the roofman. Some steps have already been taken by Respondent to reduce the hazard of falls onto the furnace roof. A steel rod with an "S" shaped hook at its end, was designed after the inspection herein, to

be used by the roofman from the lower catwalk to guide the lance into the roof hole, thus allowing this task to be performed from the catwalk, not the binder below. Some modifications in this hook have been made, and its feasibility is being tested. Evidence was adduced, that the cover, used to temporarily cover the lance hole during a change, could be equipped with an "eye" and the steel rod used to place this cover accurately over the hole, obviating the need for the roofman to descend to within 4 inches of the brick roof to adjust a misaimed, misthrown cover.

Additionally, C. O. Hrin testified that guardrails could be installed on the large binder onto which the roofman steps from the catwalk, to guide the reconditioned lance into place. No evidence was introduced showing that any of the foregoing procedures were not, or would not be, feasible.

The record herein thus satisfies the burden of proof of the Section 5(a)(1) violations charged, as announced in the National Realty case, supra.

## Penalties

Having independently considered the statutorily mandated elements for penalty assessment set forth in Section 17(j) of the Act,[21/] i.e., the size of Respondent's business, the gravity of the violations, Respondent's good faith and history of prior violations, it is concluded that the proposed penalties, are not appropriate.

---

[21/] 29 U.S.C. 666(i)

Item No. 1

The evidence establishes that the gravity of this violation is high. The inherent dangers, atop the roof of the blast furnaces at Fairless, are increased with the addition of hot metal to these furnaces. The chance of explosions or "violent eruptions", from many unpredictable water sources, with the risk of partial roof damage or collapse, and the spraying of molten steel, is real, based on the total evidence of this record. The only reason revealed in the evidence for Respondent's insistence on having millwrights change a last functioning lance at this stage of the "heat", is economic. The economic saving to Respondent is indeed, minuscule.

Three millwrights are atop the furnace during this procedure, all of whom are exposed to these unpredictable dangers. However, the millwrights did engage in only one lance change over hot metal, before their sense of self preservation took over, and they thereafter, wisely and justifiably refused to make any additional changes. Thus, as of the time of trial, employee exposure was low, due however to the employees desire for survival not to Respondent concern for the millwrights safety.

As to Respondent's size, it is the largest domestic steel producer in this country, with 167,000 employees on the average at its various plants and had gross 1976 sales approximating nine billion dollars.

It does have a history of prior violations of the Act, but the evidence is unsatisfactorily non-detailed regarding this history (Exh. C-1).

As to Respondent's good faith, the evidence establishes a striking lack thereof.

Two exhibits clearly show this lack of good faith, Exhibits C-2 and C-15, two versions of a "Safe Job Procedure" for changing lances after the addition of hot metal.

Exhibit C-2, initially issued on July 21, 1975, and revised on March 26, 1976, in Part B, sets forth the steps the employees should follow in making the lance change with hot metal in the furnace. After it became apparent to management that the millwrights were adamant in their refusal to make such lance changes (even under pain of being sent home with loss of pay), the 1975 SJP was reissued on August 11, 1977, and is Exhibit C-15. The following procedures on the 1975/76 SJP, (Exh. C-2), (all of which were designed to assure a safer procedure), were deleted in the 1977 revision, Exhibit C-15.

(Deletions from the 1975/76 SJP in brackets.)

Exhibit C-2, Part B

Paragraph

[10.3 Fuel must be off for minumum duration of 20" before lance change will start.]

[10.4 Hot metal addition must not have been made less than 60" before lance change will start.]

[10.7 Physically check to make certain that all four (4) reversing dampers are in raised position.]

10.9 Melter[22/] will check bath activity. If he deems the bath to be stable, [he will accompany the furnace Maintenance personnel to the roof for the lance change.]

10.10 [Maintenance foreman and] First Helper will maintain positions at furnace panel and make certain that no furnace controls are touched.

---

22/ A "Melter" is a management employee as opposed to a millwright.

10.11 Jet change to proceed as outlined in Steps 2-9. [Melter will remain on roof during lance change.]

[10.12 If duration of time incurred in jet change, and or furnace conditions dictate that the Maintenance personnel leave the roof to revive themselves before completion of repairs, Melter may call a "break." Work will be completed as soon as the men are refreshed.]

10.15 A. ---
B. ---
[C. No buggy activity past front of furnace.]

(Compare Exhibits C-2 and C-15; TR. 380-385).

Further, when the millwrights at Fairless were told that oxygen lances were changed after hot metal was added to the furnaces at U. S. Steel's Homestead works, they sought but were denied permission to visit the Homestead works to observe those practices for themselves. However, Respondent, at the beginning of the second day of trial, (September 2, 1977), did agree not to implement a work order at Fairless under which millwrights would be expected to change lances over hot metal, until a decision herein. (TR. 223).

Item No. 2

The gravity of this violation is less than Item No. 1, but still significant. The lance changing operation, during normal maintenance, is a common practice, 50 to 60 times a month. The four lance changing positions (groundman, roofman and two upper catwalk men) are rotated among the millwrights. Thus, 50 to 60 times a month, the millwright acting as roofman is exposed to the dangers of slipping or being knocked off the binder onto the roof structure during this process. If such an accident

occurs, the probability of death or serious physical harm is rather high. Thus the gravity of this violation is high. The evidence reveals that little was done by Respondent to protect this roofman except to provide a broom to sweep the lubricating graphite from the binder, and in 1972, to supply him with "heat resistant" clothing. The relatively simple measures to make this task safer, as alluded to supra, were either not taken, or were implemented only very recently.

Based upon the foregoing, it is concluded that a penalty of $1,000 for Item No. 1 and $800 for Item No. 2 is appropriate and reasonable upon the evidence of this record and pursuant to Section 17(j) of the Act.

## CONCLUSION

The jurisdiction of the Review Commission in this case is not contested and is established by the pleadings and stipulated facts, pursuant to Sections 3(4)(5) and 10(c) of the Act.[23/]

Based upon the foregoing and pursuant to Sections 10(c) and 12(j) of the Act,[24/] it is hereby,

ORDERED:

1. That Items numbered 1 and 2 of the Citation for Serious Violation of 29 U.S.C. 654(a)(1) are AFFIRMED.

---

[23/] 29 U.S.C. 652(4)(5) and 659(c).

[24/] 29 U.S.C. 659(c) and 661(i).

2. A penalty of $1,000 as to Item No. 1 and $800 as to Item No. 2, of said Citation, totalling $1,800, is ASSESSED.

DECISION

Before: ROWLAND, Chairman; CLEARY and COTTINE, Commissioners.

BY THE COMMISSION:

One employee of Respondent, Little Beaver Creek Ranches, Inc. ("Little Beaver"), was killed and three other employees were injured when a piece of irrigation pipe came in contact with an energized power line. The Secretary of Labor ("Secretary") issued a citation[1/] alleging that Little Beaver had violated section 5(a)(1), 29 U.S.C. § 654(a)(1), of the Occupational Safety and Health Act of 1970, 29 U.S.C. §§ 651-678 ("the Act").[2/] A penalty of $540 was proposed. Administrative Law Judge James A. Cronin, Jr., vacated the citation on the basis that Little Beaver had implemented an adequate safety

1/ The citation alleged that irrigation water pipes were not stored and handled at a safe distance from power transmission lines, insulated rubber gloves were not provided, and a protective insulated boot was not placed over power transmission lines nor were the power transmission lines deenergized.

2/ Section 5(a)(1) of the Act states: "Each employer . . . shall furnish to each of his employees employment and a place of employment which are free from recognized hazards that are causing or are likely to cause death or serious physical harm to his employees."

program with respect to the handling of irrigation pipe in the vicinity of power lines. For the reasons that follow, we reverse Judge Cronin's decision and conclude that Little Beaver committed a violation of section 5(a)(1) of the Act.

I.

Little Beaver engages in cattle ranching and farming near Frenchtown, Montana. On the morning the incident occurred, Little Beaver's foreman, Curtis Kaiser, and four high-school-aged summer employees were moving irrigation pipe. The employees were working near the south edge of a hayfield, which was separated by a 4 1/2-foot-high wire fence from the north side of an interstate highway right-of-way. A 7,200 volt power distribution line owned by Missoula Electric Cooperative ran along the right-of-way. The poles for the three-phase power line were located 8 feet from the fence. An 8-foot-long crossarm was mounted on each pole, and each end of the crossarm supported an energized line. A third line ran along the center of the poles. The line nearest the hayfield was 4 feet laterally from the fence and 24 feet above the ground; the center phase line was 8 feet laterally from the fence and 26 feet above the ground. The power line was located on flat land and was in plain view from the hayfield.

Little Beaver's employees were disconnecting sections of irrigation pipe and were loading the pipe onto a trailer so that the pipe could be moved to another hayfield. Each section of pipe was approximately 30 feet long and weighed about 30 pounds. The pipe in the hayfield was laid out in two directions -- the "main line" ran parallel to the power line, and several "hand lines," placed at intervals about 60 feet apart, ran perpendicular to the power line.

The hand lines ended about 30 feet from the fence.[3/] In lifting the pipe onto the trailer, the employees lifted the pipe about 3 1/2 to 4 feet off the ground.

Work began at 8:00 a.m. Foreman Kaiser supervised the work until 9:45 a.m., when he left the field to return to the ranch in order to receive instructions concerning the operation of a new tractor backhoe. Kaiser instructed the boys to continue moving the main line and to proceed to pick up and move the hand line. Three of the boys -- Robert DeWald, Guy Neusse, and Patrick Whelan -- had been working for Little Beaver for about a month. During that time, they had moved several hundred irrigation pipes, including some in the same hayfield. The fourth employee, Marvin Fowler, had done this work the preceding summer. Although Fowler did not have any job title, foreman Kaiser testified that Fowler "was directly under me" and that "if I wanted any particular thing done I would go to him." Pat Whelan also testified that he considered Fowler to be in charge when foreman Kaiser was not present.

The incident occurred sometime prior to 11:27 a.m., the time when the Missoula County sheriff was notified of the electrocution. Patrick Whelan, the only one of the boys to testify, did not recall what happened. His last recollection before the incident was loading pipe onto the trailer. Occupational Safety and Health Administration compliance officer Frank Bruno, however, related his conversation with Robert DeWald. DeWald told Bruno that, prior to the incident, Marvin Fowler and DeWald were loading a length of irrigation pipe when they found a gopher inside. They proceeded to shake the

---

3/ In picking up the hand line segments, the truck pulling the trailer came between the end of the hand line and the fence. Little Beaver's foreman, Kaiser, testified that the truck came within 15 to 20 feet of the fence, while one of the high-school-aged employees, Pat Whelan, testified that the truck came within 5 to 10 feet of the fence.

gopher out and load the pipe onto the trailer. After loading three more lengths of pipe, Fowler discovered another gopher in one of the pipes on the trailer. Fowler and Whelan took the pipe off the trailer, and they raised one end of the pipe to shake out the gopher. The pipe contacted the power line.

After the incident, the boys were found in the hayfield about 10 feet from the fence. Marvin Fowler died as a result of the contact of the pipe with the power line. Pat Whelan, who was in serious condition, burned his knees and a foot. Guy Neusse was seriously burned and lost "a couple of fingers." Bob DeWald received a slight burn on his thumb.

Respondent's foreman Kaiser testified that the boys were instructed numerous times to stay away from all power lines and "to have nothing to do with power." Kaiser assumed that he gave this instruction on the day of the incident, but he did not recall giving it. The boys were also instructed not to stand the irrigation pipe on end, since "there was no reason for it" and "[t]hat's not the proper way to handle them." Kaiser stated that the boys appeared to understand his instructions regarding the handling of pipe, and he did not see or know of any violation of his instructions. Whelan also testified that he and the other boys were instructed on more than one occasion not to lift pipe on end around power lines.

Finding animals in irrigation pipes was a common occurrence. Kaiser testified that the normal procedure for removing animals was to remove the plugs on the end of the sections of pipe and then to flush water through the pipe. This was the most practical method since it also removed dirt and foreign matter from the pipe. Kaiser had never seen any other procedure used to remove animals. According to Kaiser, the boys were instructed in the normal procedure and always followed the instructions. Whelan also testified that he had always used the flushing method to remove animals from irrigation pipe.

The power line that ran along the right-of-way was under the control of the Missoula Electric Cooperative ("Cooperative") and served 200 to 230 customers. About 200 miles of the Cooperative's 1200 miles of power lines were in the vicinity of irrigated fields. Norman Walker, assistant engineer for the Cooperative, stated that it was against Cooperative policy for its customers to place protective boots over power lines or to do any work on the lines. The Cooperative had company workers and equipment available to deenergize power lines when necessary. Normally a power line would be deenergized before a boot was placed on the line. However, in an emergency a boot could be installed "hot."

Walker testified that the Cooperative allowed a line to be shut off for a house move or for bridge construction. However, he was not aware of any instance when deenergization of power lines was requested by a customer for purposes of moving irrigation pipe. Walker did not know whether such a request would be granted by the Cooperative. Walker emphasized that it was the Cooperative's policy to keep power on for its customers without interruption or "with the very slightest interruption we can tolerate." Walker noted that an interruption of electrical service would cause customers' irrigation pumps to stop, and the customers would have to restart their pumps when service was restored.

Walker testified that three accidents had occurred in the area in the last five years that involved contact of irrigation pipe with power lines. One of these accidents involved an animal stuck in the irrigation pipe. Walker did not have personal knowledge of these accidents; he learned about them through safety meetings and in newspaper accounts.

II.

Judge Cronin concluded that the Secretary established a prima facie violation of section 5(a)(1) of the Act. The judge found that recognition of

the hazard of electrical shock resulting from contact with an energized 7,200 volt power line by an irrigation pipe was proved by Little Beaver's instructions to its employees not to stand lengths of pipe on end, particularly when in the vicinity of energized power lines, and by the water-flushing method used by Little Beaver to remove animals from the pipe. The death of Marvin Fowler and the serious injuries sustained by two other employees established that the hazard was likely to cause death or serious physical harm to employees. The judge also found that it was feasible to eliminate the hazard by prohibiting employees from standing pipe on end within contact distance of a power line.

The judge further concluded that the worksite was not free of hazards because Little Beaver's employees had struck an electric power line while placing a section of irrigation pipe on end. He also found that the Secretary established a prima facie showing of employer knowledge. The judge imputed to Little Beaver the knowledge of Fowler, whom the judge found to be a supervisory employee. Fowler was found to have knowledge of the violative condition based upon his participation in raising the pipe on end to remove the gopher.

The judge, however, concluded that Little Beaver's instructions and workrules concerning the cited hazard rebutted the Secretary's prima facie showing of employer knowledge. The judge pointed to Little Beaver's instructions to its employees not to raise pipes on end in the vicinity of power lines and to follow the flushing procedure for removing animals. The judge found it significant that there was no evidence that the boys had deviated from the employer's instructions prior to the incident. The judge also relied upon Whelan's testimony that he understood foreman Kaiser's instructions not to raise irrigation pipe in the vicinity of power lines.

Judge Cronin found that the young ages of Little Beaver's workers did not necessitate additional instructions. The judge pointed out that the work

involved was a simple operation that had been performed by the employees hundreds of times previously. Further, the judge found it significant that there was no evidence that the employees because of their youth did not understand the employer's instructions or failed to appreciate the hazard involved.

The judge also concluded that the Secretary had failed to prove that it was feasible to eliminate the hazard by deenergizing the power line or insulating the line with a boot. He pointed out that the power line was in the exclusive control of the Cooperative and that it was the Cooperative's policy not to disrupt customer service by deenergizing a distribution line or by insulating a "hot" line with a boot. The judge concluded that a request to the Cooperative to interrupt power service would be a useless act.

III.

The Secretary contends that Little Beaver's safety training and supervision were inadequate and that therefore Little Beaver should be found in violation of section 5(a)(1). The Secretary maintains that Little Beaver's general instructions to its employees "not to have anything to do with" power lines and not to turn pipes on end were insufficient to protect Little Beaver's employees from the cited electrical hazard. The Secretary also argues that Little Beaver's communication and enforcement of its safety rules were deficient. The Secretary asserts that the participation of Little Beaver's supervisor Fowler in the upending of irrigation pipe on the morning of the accident is strong evidence that Little Beaver's implementation of its safety policy was lax. The Secretary further contends that the judge erred in concluding that, despite the young ages of Little Beaver's employees, additional safety instructions to the employees were not necessary.

Even assuming that Little Beaver's safety program was adequate, the Secretary contends that a section 5(a)(1) violation should be found based on

Little Beaver's failure to deenergize or insulate the power line. According to the Secretary, the feasibility of deenergizing the power line was established by the Cooperative's history of honoring requests from private parties to deenergize lines under certain circumstances, such as bridge construction or a house move, and by testimony that the Cooperative had the necessary equipment and trained employees available to deenergize the line. The Secretary further maintains that deenergization or insulation of the power line should not be found to be infeasible since Little Beaver never asked the Cooperative to deenergize or insulate the line.

With respect to the adequacy of its safety program, Little Beaver argues that Judge Cronin's findings and conclusions are supported by a preponderance of the evidence and that in consequence his rulings should not be disturbed by the Commission. Citing Universal Camera Corp. v. National Labor Relations Board, 340 U.S. 474 (1951), and Accu-Namics, Inc. v. OSHRC, 515 F.2d 828 (5th Cir. 1975), cert. denied, 425 U.S. 903 (1976), Little Beaver asserts that the Commission has no authority to substitute its interpretation of the evidence for that of the judge. As for its failure to deenergize or insulate the power line, Little Beaver contends that the burden was on the Secretary to prove that this was a feasible means of abatement and that the Secretary did not carry his burden.[4/]

---

4/ Little Beaver also maintains that the Secretary's petition for review failed to plainly and concisely indicate the issues on review and to properly cite the record, which Little Beaver asserts is required by the Commission Rules of Procedure. Little Beaver refers to former Commission Rule 91a(c), 29 C.F.R. § 2200.91a(c) (1977), which was in effect when this case was directed for review. It states, in pertinent part:

> (c) Each issue [in the petition for discretionary review] shall be separately numbered and plainly and concisely stated, and shall be supported by citations to

(Continued)

IV.

Section 8(a)[5/] of the Administrative Procedure Act provides that an agency's review of the decisions of its administrative law judges may extend to all issues squarely raised by the record as a whole. Therefore, the Commission's review authority includes the authority to decide all issues it could have decided as the initial decision maker. The Commission is not limited to the role of a reviewing court that must sustain factual findings of administrative agencies if such findings are supported by substantial evidence. The ultimate responsibility for decision is placed in the Commissioners to discharge the function of administering the Act.

---

4/ (Continued)

> the record when assignments of error are based on the record, and by citations to statutes, regulations, or principal authorities relied upon.

Little Beaver contends that, because the Secretary's petition did not comply with this requirement, Little Beaver was "left to guess . . . the basis upon which review is sought."

This contention is groundless. The Commission has held that, notwithstanding any possible noncompliance with its rules governing petitions for discretionary review, the issues stated in the direction for review are properly before the Commission. United States Steel Corp., 81 OSAHRC 28/C2, 9 BNA OSHC 1641, 1981 CCH OSHD ¶ 25,282 (No. 76-5007, 1981). Further, we find that the Secretary's petition for review was sufficient to place Little Beaver on notice of the basis upon which review was sought.

5/ Section 8(a) of the APA, 5 U.S.C. 557(b), provides in pertinent part:

> When the agency did not preside at the reception of the evidence, the presiding employee . . . shall initially decide the case unless the agency requires, either in specific cases or by general rule, the entire record to be certified to it for decision. When the presiding employee makes an initial decision, that decision then becomes the decision of the agency without further proceedings, unless there is an appeal to, or review on motion of, the agency within time provided by rule. On appeal from or review of the initial decision, the agency has all the powers which it would have in making the initial decision except as it may limit the issues or by rule.

(emphasis added)

Accu-Namics, Inc. v. OSHRC, supra; Stevens Equipment Co., 73 OSAHRC 17/A2, 1 BNA OSHC 1227, 1971-73 CCH OSHD ¶ 15,691 (No. 1060, 1973). Accordingly, Little Beaver's argument that we may not disturb the judge's disposition in this case is without merit.

In order to establish a section 5(a)(1) violation, the Secretary must prove: (1) the employer failed to render its workplace free of a hazard, (2) the hazard was recognized either by the cited employer or generally within the employer's industry, (3) the hazard was causing or was likely to cause death or serious physical harm, and (4) there was a feasible means by which the employer could have eliminated or materially reduced the hazard. Baroid Division of NL Industries, Inc. v. OSHRC, 660 F.2d 439 (10th Cir. 1981); St. Joe Mineral Corp. v. OSHRC, 647 F.2d 840 (9th Cir. 1981); National Realty & Construction Co. v. OSHRC, 489 F.2d 1257 (D.C. Cir. 1973); Whirlpool Corp., 79 OSAHRC 32/A14, 7 BNA OSHC 1356, 1979 CCH OSHD ¶ 23,552 (No. 9224, 1979), rev'd on other grounds, 645 F.2d 1096 (D.C. Cir. 1981); see United States Steel Corp. No. 77-1796 (June 30, 1982).

A recognized hazard is a condition or practice in the workplace that is known to be hazardous either by the industry in general or by the employer in particular. Beaird-Poulan, A Division of Emerson Electric Co., 79 OSAHRC 21/D11, 7 BNA OSHC 1225, 1979 CCH OSHD ¶ 23,493 (No. 12600, 1979); see Continenetal Oil Co. v. OSHRC, 630 F.2d 446, 448 (6th Cir. 1980), cert. denied, 101 S. Ct. 1481 (1981). In this case, the judge correctly determined that contacting an energized 7,200 volt power line with a length of irrigation pipe is a hazard likely to cause death or serious physical harm and that Little Beaver recognized this electrical hazard. The judge also correctly concluded that Little Beaver's employees were exposed to this hazard and that it was feasible to protect against this hazard by prohibiting employees from raising a pipe on end within contact distance of a power line.

We disagree, however, with Judge Cronin's conclusion that Little Beaver should not be found in violation of section 5(a)(1) because its safety program was adequate with respect to the handling of irrigation pipe in the vicinity of power lines. We find that several factors, in combination, lead to the conclusion that Little Beaver's safety program was inadequate.[6/] Therefore, we hold that Little Beaver failed to render its worksite free of the cited hazard.

First, the judge underestimated the significance of the young age of the employees in his evaluation of Little Beaver's safety program. While the judge correctly pointed out that the work of moving pipe was routine, apparently he did not consider that high-school-aged employees may not appreciate the danger of workplace hazards such as power lines and may be prone to disregard safety rules. Certainly, more explicit and frequent safety instructions are necessary for employees of such age and experience than for older and more experienced employees. Danco Construction Co., 77 OSAHRC 189/B1, 5 BNA OSHC 2043, 1977-78 CCH OSHD ¶ 22,280 (No. 12847, 1977), aff'd, 586 F.2d 1243 (8th Cir. 1978) ("Danco").[7/]

---

6/ When elimination of a particular hazard requires employees to follow certain procedures, the employer must take the steps necessary to assure that employees follow those procedures. General Dynamics Corp., Quincy Shipbuilding Div. v. OSHRC, 599 F.2d 453, 458 (1st Cir. 1979); National Realty & Constr. Co., supra; Western Massachusetts Elec. Co., 81 OSAHRC 63/B13, 9 BNA OSHC 1940, 1981 CCH OSHD ¶ 25,470 (No. 76-1174, 1981). An employer's safety program is adequate if it includes workrules designed to prevent the violation at issue, those rules are effectively communicated to employees, the employer takes steps to discover violations, and the employer effectively enforces the rules when violations are discovered. Western Massachusetts Elec. Co., supra.

7/ In Danco, the Commission rejected the employer's defense of unpreventable employee misconduct and found the employer in violation of the standard at 29 C.F.R. § 1926.550(a)(15)(i) (operation of crane within 10 feet of energized power line prohibited). The Commission in Danco found it significant that two

(Continued)

Moreover, Little Beaver's instructions to employees to "stay away from power lines" and to have "nothing to do with power" were insufficient to apprise the employees of the required conduct. Specific safety instructions and workrules concerning hazards peculiar to the job being performed are the essential foundations of an adequate safety program. Iowa Southern Utilities Co., 77 OSAHRC 32/C10, 5 BNA OSHC 1138, 1977-78 CCH OSHD ¶ 21,612 (No. 9295, 1977). In this case the employees were not told how far to keep the irrigation pipe away from power lines, nor were they informed of the magnitude of the danger of contacting pipe with the power lines. While one employee, Pat Whelan, testified that he understood his foreman's safety instructions, there is no evidence that Whelan or the other employees who were exposed to the hazard were told of the rationale underlying Little Beaver's safety rules or were informed about the severity of the electrocution hazard. As the Commission reiterated in New England Telephone & Telegraph Co., 80 OSAHRC 54/A2, 8 BNA OSHC 1478, 1490, 1980 CCH OSHD ¶ 24,523 at p. 30,000 (No. 76-3010, 1980), "Rules are more likely to be observed if their rationale is understood and it is made clear that they are not just arbitrary pronouncements but are grounded in practical reasons of safety." See also Martin Painting & Coating Co., 77 OSAHRC 181/E8, 5 BNA OSHC 1946, 1977 CCH OSHD

---

7/ (Continued)

employees who were approximately 18 years old had not been given specific safety instructions concerning electrical hazards. The Eighth Circuit, in affirming the Commission's decision, found that there was substantial evidence supporting the Commission's conclusion that the employer could have prevented the violation. The court pointed out that "[t]he company left unsupervised a young, inexperienced, and largely untrained crew working in close proximity to a dangerous power source." 586 F.2d at 1247.

The judge distinguished Danco from this case on the basis that the work involved in this case was not complex. However, the work performed by the youthful work crew in Danco, the unloading of steel pipe from a truck and stacking the pipe on skids, also was not complex in nature.

¶ 22,239 (No. 15923, 1977), aff'd, 629 F.2d 437 (6th Cir. 1980), cert. denied, 449 U.S. 1062 (1980).

Finally, the participation of two employees, including Fowler, the employee in charge at the time,[8/] in the lifting of irrigation pipe near the power lines indicates that Little Beaver's implementation of its safety program was inadequate. It is significant that more than one employee felt free to disregard the workrule. Moreover, while safety instructions were given at some time, Little Beaver's foreman Kaiser was uncertain whether safety instructions prohibiting the lifting of pipe near power lines were given on the day of the incident. We therefore conclude that Little Beaver's safety instructions were not sufficiently communicated to employees so that the employees could be expected to follow the rules and perform their work safely. See Danco Construction Co., supra; Chapman & Stephens Co., 77 OSAHRC 77/A2, 5 BNA OSHC 1395, 1977-78 CCH OSHD ¶ 21,802 (No. 13535, 1977).[9/]

---

8/ Judge Cronin's finding that Fowler was a supervisory employee for purposes of the Act was not challenged by either party on review. As the Court of Appeals for the District of Columbia Circuit noted in National Realty & Constr. Co., supra at 1267 n. 38, the fact that a supervisor feels free to breach a company safety policy is strong evidence that implementation of that policy is lax.

9/ We reject Little Beaver's argument that the three cases it cited in support of the judge's decision are persuasive in this case. One of the cases it cited, Norman Franzen d/b/a Norm's Trailer Sales, 74 OSAHRC 38/C13, 2 BNA OSHC 3066, 1973-74 CCH OSHD ¶ 17,798 (No. 3710, 1974), is an unreviewed administrative law judge's decision and, thus, lacks precedential value and is not binding on the Commission. Leone Constr. Co., 76 OSAHRC 12/E6, 3 BNA OSHC 1979, 1975-76 CCH OSHD ¶ 20,387 (No. 4090, 1976). Another administrative law judge's decision on which Respondent relied, Martin Painting & Coating Co., 77 OSAHRC 181/E8, 1976-77 CCH OSHD ¶ 20,808 (No. 15923, 1976), was subsequently reversed by the Commission, and the Commission's decision was affirmed by the court of appeals. 5 BNA OSHC 1946, 1977-78 CCH OSHD ¶ 22,239 (1977), aff'd, 629 F.2d 437 (6th Cir. 1980), cert. denied, 449 U.S. 1062 (1980). The final case cited by Respondent, Norman R. Bratcher Co., 73 OSAHRC 7/C2, 1 BNA OSHC 1152, 1971-73 CCH OSHD ¶ 15,501 (No. 83, 1973), is dissimilar from the present case in that in Bratcher a painting

(Continued)

Although we conclude that Little Beaver's safety program was inadequate, we agree with Little Beaver's argument that insulating or deenergizing the power line was not feasible.[10/] Insulating or deenergizing the power line would have caused an interruption of power to the 200 to 230 customers served by the line.[11/] Little Beaver's field was adjacent to the power line, and irrigation pipes in the field were frequently, if not constantly, being moved. Therefore, requiring insulation or deenergizing of the line every time pipes in its vicinity were moved would cause frequent power outages and would require other customers with irrigated fields to restart their electric pumps when service was restored. Moreover, the policy of the Missoula Electric Cooperative, which owned the line, was to keep power on without interruption or "with the very slightest interruption [the Cooperative] can tolerate." Thus, it is hardly conceivable that the Cooperative would permit, or its customers would tolerate, the frequent power interruptions that would be necessary if the line were insulated or deenergized every time irrigation pipes were moved in its vicinity.

Moreover, it was possible for employees to do their work without lifting the pipes more than 4 feet off the ground, and the power line was at a height

---

9/ (Continued)

contractor's employees' use of an aluminum ladder near a power line some distance from the building to be painted was held to be an unforeseen occurrence and hence not a violation of § 5(a)(1); in this case Respondent knew that its employees were moving pipes near the power line.

10/ The citation also charged Little Beaver with failure to provide insulated gloves. However, this issue was not litigated at the hearing, and the judge properly concluded that a violation could not be found on this basis.

11/ Except in an emergency, a power line was deenergized before an insulated boot was placed on it. Thus, insulating a power line would not avoid the need to interrupt power.

of 24 feet and was several feet beyond the fenced perimeter of the field. Therefore, it was possible for the work to be accomplished safely without deenergizing or insulating the line, if proper work practices were followed.

The Secretary points out that in Chapman & Stephens Co., supra, the Commission found that it was feasible for a power line passing through the employer's citrus grove to be deenergized even though the line was under the control of a power company. However, Chapman & Stephens is factually distinct from the present case. In Chapman & Stephens an employee pulled a bent twenty-foot sprinkler pipe from its base and contacted an overhead power line 10 1/2 feet away. The removal of the pipe was to repair the bend in the pipe and was not a routine event. The number of customers served by the line was not shown. Unlike the present case, requiring the power line in Chapman & Stephens to be deenergized every time a sprinkler pipe below it was removed would not have necessitated frequent power outages, because removal was not routine. Also, since the number of customers on the line was not shown, it was unclear whether deenergizing the line would have caused much inconvenience to others. Additionally, the pipe was much closer to the power line than that in the present case and, thus, the pipe probably could not have been removed safely, even with proper work practices, unless the line was deenergized. Thus, the Commission's decision in Chapman & Stephens does not compel a finding that it would have been feasible to deenergize or insulate the power line in this case.

V.

For the foregoing reasons, Judge Cronin's vacation of the citation is reversed. The critera for a section 5(a)(1) violaton of the Act have been met, and hence the citation is affirmed. Considering the gravity of the violation

and Little Beaver's size, good faith and prior history, we assess a penalty of $540.

SO ORDERED.

FOR THE COMMISSION

Ray H. Darling, Jr.

Ray H. Darling, Jr.
Executive Secretary

DATED: JUN 30 1982

ROWLAND, Chairman, dissenting:

I dissent from the majority's opinion insofar as it concludes that Little Beaver's safety program was insufficient to render the worksite free from the cited hazard. Accordingly, I would affirm Judge Cronin's decision to vacate the citation for an alleged violation of section 5(a)(1).

The obligation imposed on each employer by section 5(a)(1) to furnish a workplace "free from" recognized hazards does not make the employer an insurer or guarantor of his employee's safety. National Realty & Construction Co. v. OSHRC, 489 F.2d 1257, 1265-66 (D.C. Cir. 1973); see Brennan v. OSHRC (Raymond Hendrix) 511 F.2d 1139, 1144-45 (9th Cir. 1975), Brennan v. Butler Lime & Cement Co., 520 F.2d 1011, 1017 (7th Cir. 1975). An employer satisfies his duty under section 5(a)(1) if he takes all reasonably necessary precautions, such as implementing safety rules, to prevent reasonably predictable exposure to recognized hazards. General Dynamics Corp., Quincy Shipbuilding Division v. OSHRC, 599 F.2d 453, 458 (1st Cir. 1979). Consequently, an allegation by the Secretary that the workplace was not "free from" a recognized hazard cannot be sustained when the evidence shows that the employer issued unambiguous and well-communicated safety rules, which were directed toward the hazard and which the employer reasonably expected the employees to follow. Jones & Laughlin Steel Corp., No. 76-2636 (June 25, 1982); United States Steel Corp., 81 OSAHRC 28/C2, 9 BNA OSHC 1641, 1981 CCH OSHD ¶ 25,282 (No. 76-5007, 1981) cited at n. 4, supra.

Based on the evidence in the record, Judge Cronin vacated the alleged violation of section 5(a)(1) because Little Beaver repeatedly communicated specific safety instructions, warning the employees of the overhead power lines, admonishing the employees against inverting the irrigation pipes, and directing the employees to flush the gophers from the pipes with water. The majority rejects Judge Cronin's

conclusion that Little Beaver's safety program was adequate. 12/ I disagree.

The majority reasons that Judge Cronin underestimated the significance of the "young" age of the employees. However, the judge fully took into account the age of the employees when assessing the adequacy of Little Beaver's work rules. Judge Cronin explained that additional safety instructions were not needed, despite the age of the boys, because moving irrigation pipes and removing gophers were simple tasks which the employees had correctly performed numerous times before. The judge's reasoning is supported by the uncontradicted testimony of foreman Kaiser, who stated that the employees were experienced in moving irrigation pipes and had moved "many, many hundreds of them." As Judge Cronin noted, the evidence shows that the employees had never deviated from Little Beaver's safety procedures when transporting pipes and removing gophers, in contrast to the majority's speculation that the "young" employees "may be prone to disregard safety rules." Contrary to the assertion of the majority that Judge Cronin failed to consider whether the high-school-age employees would "appreciate the danger" of contacting the power lines, Judge Cronin accepted as true the uncontradicted testimony of Pat Whelan, one of the high-school-age employees. Whelan stated at the hearing that he was aware of the power lines and that he knew from foreman Kaiser's instructions that he should not tilt pipes on end to remove gophers, especially in the vicinity of power lines. The judge specifically determined that Whelan's testimony showed Whelan knew and <u>understood</u> the safety rules. 13/ The judge's implicit determination that Whelan's testimony

---

12/ Judge Cronin concluded that the evidence establishing the adequacy of Little Beaver's safety instructions sufficiently negated the Secretary's allegation of employer knowledge. I note that the evidence showing that Little Beaver's safety program was sufficient, and that the employees unexpectedly deviated from the workrules, establishes both that Little Beaver rendered its workplace "free from" the hazard and that Little Beaver lacked knowledge of employee exposure to the hazard.

13/ The majority relies on <u>Danco</u>, p. 11 <u>supra</u>, in which the Commission and the Court of Appeals mentioned the young age of the workcrew. However, both the Commission and the Court of Appeals emphasized that the employees

(Continued)

was credible should not be disturbed on review. See, e.g., Kus-Tum Builders, Inc., 81 OSAHRC 97/B2, 10 BNA OSHC 1128, 1981 CCH OSHD ¶ 25,738 (No. 76-2644, 1981). Since Commission precedent holds an employer's safety rules are adequate if they are understood and previously followed by the employees, the judge correctly determined that Little Beaver's safety program was not rendered inadequate by the age of the workers. United States Steel Corp., supra, 9 BNA OSHC at 1644, 1981 CCH OSHD at pp. 31,251-52.

The majority further concludes that the instruction to have "nothing to do with power" was not sufficiently precise. But, as the judge noted, the employees were also told not to stand the pipes on end and to flush the animals from the pipes with water. Kaiser warned the employees of the existence and location of the power lines, thus suggesting that the employees were aware of the rationale behind Little Beaver's safety rules. Indeed, the OSHA compliance officer admitted that the accident would not have occurred but for a deviation from Little Beaver's specific instructions, which the compliance officer aptly summarized as a rule "not to invert irrigation pipe because of the hazard involved of the overhead power lines."

Nor do I agree with the majority's contention that the rules were not adequately implemented. The majority emphasizes that more than one employee, including Fowler, violated the rules and that the foreman Kaiser was not sure if he communicated the workrules on the day of the accident. I do not find that evidence

---

13/ (Continued)

in Danco had not been given specific safety instructions on a regular basis. Conversely, the employees here were issued specific instructions on numerous occasions and understood those instructions. Moreover, Little Beaver's employees were experienced, unlike the inexperienced workers in Danco. See 586 F.2d at 1247. Accordingly, I agree with Judge Cronin that this case is distinguishable from Danco.

dispositive. It is undisputed that Little Beaver issued the safety instructions on numerous occasions, and that Whelan, the only high-school-age employee who testified at trial, understood those rules. Although foreman Kaiser could not specifically remember, he assumed that he reiterated Little Beaver's safety program on the day of the accident, based on his habit of repeatedly communicating the safety instructions to the employees. More importantly, the employees, including Fowler, had never disregarded the workrules previously and had been observed correctly following the safety procedures immediately before the accident. See National Realty & Construction Co., supra, at 1266 (an employer is not responsible under section 5(a)(1) for unexpected, idiosyncratic deviations from his safety program). Therefore, contrary to the majority's contention, the record supports the judge's conclusion that Little Beaver implemented adequate safety instructions which Little Beaver could reasonably expect would be followed by the employees.

In light of Little Beaver's safety program, I conclude that Little Beaver freed its workplace from the hazard of contacting energized, overhead power lines with irrigation pipes. Because an alleged violation of section 5(a)(1) cannot be sustained when the Secretary does not establish that the employer failed to render its workplace "free from" the recognized hazard, I would affirm the judge's vacation of the citation.

UNITED STATES OF AMERICA

OCCUPATIONAL SAFETY AND HEALTH REVIEW COMMISSION

| | |
|---|---|
| SECRETARY OF LABOR,<br>Complainant,<br>v.<br>LITTLE BEAVER CREEK RANCHES, INC.,<br>Respondent. | OSHRC DOCKET NO. 77-2096 |

APPEARANCES:

Ann M. Noble, Trial Attorney, U. S. Department of Labor, for the Complainant,

Sam E. Haddon, Esq., Boone, Karlberg & Haddon, Missoula, Montana, for the Respondent.

DECISION AND ORDER

Cronin, Judge, OSHRC:

As a result of an investigation of an accident fatality occurring on June 10, 1977 at a respondent worksite, the Secretary of Labor issued respondent, Little Beaver Creek Ranches, Inc., a citation alleging a serious violation of Section 5(a)(1) of the Occupational Safety and Health Act (29 U.S.C. §654(a)(1)). A penalty of $540.00 was proposed.

The alleged violation is described in the citation as follows:

> Section 5(a)(1) of Public Law 91-596: The employer failed to furnish to each of his employees a place of employment which was free from recognized hazards that were likely to cause death or serious physical harm to his employees in that the storage and handling of irrigation water pipes were not at a safe distance from power transmission lines; insulated rubber gloves were not provided; a protective insulated boot was not placed over power transmission lines, nor were the power transmission lines deenergized.

Section 5(a)(1) of the Act provides:

> Each employer--
> (1) shall furnish to each of his employees employment and a place of employment which are free from recognized hazards that are causing or are likely to cause death or serious physical harm to his employees;

## ISSUES

Little Beaver Creek challenges Commission jurisdiction by specifically denying it is engaged in a business affecting commerce. Little Beaver Creek also denies the allegations of violation and additionally defends on the ground that the power lines in question were under the exclusive ownership, possession, and control of the Missoula Electric Cooperative, Inc. Lastly, Little Beaver Creek contends in its brief the complaint should be dismissed because it is based on information obtained by a warrantless search.

The issues to be determined are:

(1) Whether Little Beaver Creek is an employer engaged in a business affecting interstate commerce?

(2) Does the Secretary's failure to obtain a warrant before conducting his investigation or inspection require vacation of the citation?

(3) Did Little Beaver Creek commit the alleged violation June 10, 1977, and if it did, what penalty is appropriate?

## JURISDICTION

Little Beaver Creek employs 11 persons and raises cattle for future sale as breeding stock throughout the United States and overseas (Tr. 56, 105-106). On these facts, Little Beaver Creek clearly engages in a business affecting interstate commerce and is an "employer" as that term is defined in Section 3(5) of the Act. Jurisdiction, therefore, is conferred on this Commission.

## WARRANTLESS SEARCH

Respondent cites Empire Steel Manufacturing Co. v. Marshall, No. CV 77-48 - BLG (U.S. District Court, District of Montana, September 1, 1977) in support of its contention that the warrantless search by the compliance officer requires vacation of the citation. Respondent's reliance on that case is misplaced. There, the Court held that the Fourth Amendment prohibits warrantless non-consensual inspections under the Act. Here, respondent did not resist or object to the inspection of its worksite; General Manager Hubman cooperated fully, and accompanied the compliance officer on his four hour inspection of the accident site on June 15, 1977 (Tr. 97). Because the search was purely consensual, the principles enunciated in Empire Steel are inapposite. By permitting the inspection, respondent now cannot complain it was conducted without a warrant. See Lake Butler Apparel Co. v. Secretary of Labor, 519 F.2d 84 (5th Cir., September 15, 1975).

## FINDINGS OF FACT

Upon the credible evidence of record the following facts are found; proposed findings of facts submitted by the parties inconsistent therewith are denied.

1. Respondent, Little Beaver Creek Ranches, Inc., a corporation, engages in cattle ranching, and employs 11 persons. Little Beaver Creek's cattle are sold as breeding stock throughout the United States and overseas (Tr. 56, 105-106).

2. On June 10, 1977, Little Beaver Creek had in its employ four "boys", Marvin Fowler, Robert Dewald, Guy Nuesse, and Pat Whelan. These employees, under the supervision of respondent's foreman, Curtis Kaiser, were engaged in moving irrigation pipe lines from one pasture area to another. Foreman Kaiser supervised the work from 8:00 a.m. until 9:45 a.m. when he left the field and returned to the ranch to receive instructions on how to operate a new tractor backhoe (Tr. 57, 59).

3. The pasture or hayfield in question borders the north side of Interstate 90 right-of-way, west of Frenchtown, Montana. At this location, the right-of-way runs in an east to west direction. The south line of the hayfield and the north line of the highway right-of-way is marked by a fence constructed of woven and barbed wire, approximately four and one-half feet high.

4. The Huson west distribution power line of the Missoula Electric Cooperative runs in an east-west direction within the boundaries of the highway right-of-way, south of the pasture. The poles for the three phase line are located 8 feet south of the fence dividing the right-of-way and the pasture. The poles are equipped with an eight foot long crossarm with an energized wire attached to each end, and center, of the arm. From each phase to ground the total voltage is 7,200 volts, and from phase to phase it measures 12,500 volts. The phase wire nearest to the pasture is located 24 feet over a point in the right-of-way, four feet south of the fence line; the center phase wire is 26 feet above the ground. This distribution power line was installed approximately 7 years ago and is not obscured from view (Tr. 13-22, 26-26; Exhibit C-1).

5. The Huson west line serves approximately 200 to 250 customers and is under the exclusive control of the Missoula Electric Cooperative. Missoula Electric, as a matter of policy, would not permit the de-energizing of this power line and interruption of service to 200 plus customers for the purpose of moving irrigation pipe (Tr. 33).

Missoula Electric does not permit anyone other than its own employees to work on its power lines or to place facilities on these lines. When irrigation pipe is moved, it is not the policy of Missoula Electric to permit facilities, such as a protective insulated boot, to be placed on the power lines (Tr. 33-36).

6. Prior to June 10, 1977, Little Beaver Creek, through its foreman and manager, had instructed the four boys concerning the movement and handling of irrigation pipe, and on numerous occasions had told the

boys to stay away from all power lines. "They was told that they was there and not to have anything to do with any power." They were specifically instructed not to stand an irrigation pipe on end (Tr. 62, 64, 117). Although Foreman Kaiser assumes he also so instructed the boys on June 10th, he does not recollect it (Tr. 62). Pat Whelan, age 16, confirms that he previously has been instructed not to stand a pipe on end in the vicinity of a power line (Tr. 81-82, 87).

7. It is a common occurrence on respondent's ranch for animals, such as gophers, to get into the irrigation pipes, and Little Beaver Creek has adopted a standard procedure to remove them. The lines are laid out on the ground and flushed out with water (Tr. 75-76). Prior to June 10th, the four boys had been instructed in, and had followed, this procedure (Tr. 76-77). The foreman had never seen them deviate from this procedure (Tr. 77). Pat Whelan confirmed he had received instructions concerning flushing animals out of a pipe, and prior to June 10th had never seen anybody stand a pipe on end to get an animal out of a pipe (Tr. 88).

8. Three of the four employees working on June 10th had been under Foreman Kaiser's supervision for about a month. The fourth employee, Marvin Fowler, had worked for respondent the previous summer, and was considered by respondent "senior" to the other three boys. If foreman Kaiser wanted the boys to perform any task he, "more or less", would relay instructions to the three boys through Marvin Fowler (Tr. 74-75). Pat Whelan considered Marvin Fowler to be in charge when Foreman Kaiser was absent (Tr. 88).

9. The four employees working on June 10th were experienced in handling and moving irrigation pipe, and previously had moved hundreds of pieces of pipe. Some of this handling and movement of pipe had been carried out in the same field. On June 10th, the trailer on which the pipe was being loaded for transportation to the other part of the field consisted of a two-wheeled frame, towed by a pickup truck. The frame of the trailer was approximately three and one-half feet high. The pipe to be loaded was approximately thirty feet in length. The method adopted and followed by respondent in loading the pipe is for two workmen to each pick up an end of a length of pipe, lift it approximately three and one-half feet above the ground and place it on the pipe trailer. Workmen are instructed not to stand a pipe on end, and to flush animals out of the pipe when discovered. The four employees working on June 10th had received and understood the instructions given to them by their supervisors for handling and use of irrigation pipe, and none of them had been observed deviating from any of these instructions prior to June 10, 1977. (Tr. 62, 64, 76-77, 81-82, 87-88, 117.)

10. On June 10th, a part of the pipe to be loaded had been laid out on the ground in the field north of the fence separating the field from the right-of-way. The four boys were working approximately ten to twenty feet from the fence, inside respondent's property, as they loaded the pipe. There was no danger of the boys contacting the power line as the pipe was loaded if the pipe was loaded in accordance with respondent's procedure and instructions.

11. When loading pipe on the trailer on June 10th, Robert Dewald discovered a gopher inside a length of pipe. Marvin Fowler and he shook the gopher out and loaded the length on the pipe trailer. They continued to load pipe; Marvin Fowler then discovered another gopher in another length of pipe that had been loaded on the trailer. Pat Whelan took the length of pipe off the trailer, and "they" then stood the pipe up on end to shake the gopher out. The pipe, 31 feet 6 inches in length, came into contact with the energized power line closest to the property line and the center line, causing electrical shock to all four employees. Marvin Fowler was fatally injured (Tr. 19-20, 97-103, 115-116; Exhibits C-1, 3, 4, 5).1/

12. Removing animals from irrigation pipe is an employment task respondent assigns its employees. The employees' actions, however, leading to the pipe's contact with the power line on June 10th, were the result of negligent conduct by the employees standing the pipe up on end, were contrary to respondent's specific instruction, were unnecessary to achieve removal of the gopher from the pipe, and were unforeseeable.

13. Prior to June 10, 1977, the respondent, initiated and conducted a practical safety program capable of preventing its employees from coming into contact with energized power lines.

---

1/ Exhibit C-3 was offered in evidence without objection, and has been made part of the record (Tr. 99).

## DISCUSSION

The citation for serious violation of 29 U.S.C. §654(a)(1) will be vacated.

To establish a violation of the so-called "general duty" clause or section of the Act, the Secretary of Labor must prove, "(1) that the employer failed to render its workplace 'free' of a hazard which was (2) 'recognized' and (3) 'causing or likely to cause death or serious harm.'" National Realty & Construction Company v. OSHRC and Secretary of Labor, 489 F.2d 1257 (D.C. Cir. 1973).

Unquestionably, the evidence introduced at the October 27, 1977 hearing establishes that contacting an energized 7200 volt power line with a length of irrigation pipe is a hazardous practice likely to cause death or serious physical harm, and that respondent so recognizes it. The potential of this practice for death or serious physical injury, of course, is made plain by the tragic death of Marvin Fowler and the serious injuries suffered by two other respondent employees on June 10th. That respondent recognizes such conduct as hazardous was shown by respondent's instructions to its employees not to stand lengths of pipe on end, particularly when in the vicinity of energized power lines, and by the water flushing method adopted and used by respondent to remove animals from the pipes.

Respondent's duty, however, is to eliminate only "preventable" instances of the recognized hazardous practice of contacting an energized power line with a length of pipe; and the Secretary has the burden of demonstrating the feasibility and likely utility of the particular measures

he alleges respondent did not use to prevent the hazard, National Realty, supra. The Secretary's citation alleges, in effect, that the hazard associated with contacting an energized power line could have been totally eliminated if respondent had deenergized the power line or insulated it by means of an insulated boot.2/ The evidence, however, fails to show the feasibility or practicality of these procedures.

The power line in question is outside of respondent's leased property and under the exclusive control and possession of the Missoula Electric Cooperative; respondent, thus, cannot be expected to deenergize or insulate the line. Respondent also cannot be held liable for failing to request Missoula Electric to deenergize or insulate. Missoula Electric's policy is not to disrupt customer service by deenergizing a distribution line, and not to insulate a "hot line", when irrigation pipe is being relocated in the vicinity of its power lines. Under the circumstances, a request to Missoula would constitute a futile and useless act.

However, the record does establish an obvious safety precaution available to respondent to preclude employee contact with energized power lines - simply prevent employees from standing the lengths of irrigation pipe on end within contact distance of a power line. The adequacy and efficacy of this method was raised, put in issue by respondent, and tried by the parties. This method is practical, and would eliminate contact with power lines.

Therefore, when respondent employees stood the pipe on end and contacted the power line on June 10th, respondent's worksite clearly was not "free" from a "preventable" recognized hazard. If an employer,

---

2/ The citation also cites respondent for failure to provide insulated rubber gloves. But the record contains no mention of gloves; and no evidence was introduced to establish that such gloves were not provided or that the gloves would protect employees from serious harm when a length of pipe contacts an energized power line.

however, lacks either actual or constructive knowledge of a condition which contravenes either a standard or the general duty clause, he cannot be expected to prevent that condition, and, therefore, cannot be held in violation of the Act. Cf. Packerland Packing Co. of Texas, No. 13315, November 17, 1977, citing Green Construction Company & Massman Construction, 76 OSAHRC 134/D9, 4 BNA OSHC 1808, 1976-77 CCH OSHD para. 21,235 (No. 5356, 1976).

The Commission has held that the Secretary can carry his burden and made a prima facie case of employer knowledge by showing that a "supervisory" employee had either actual or constructive knowledge of the violative condition. Ocean Electric Corp., 75 OSAHRC 6/C14, 3 BNA OSHC 1705, 1975-76 CCH OSHD para. 20,167 (No. 5811, 1975). The employer then may rebut the prima facie case by showing he has exercised reasonable diligence by taking all reasonable steps to prevent the violation. Ocean Electric Corp., supra; Horne Plumbing & Heating Co. v. OSHRC, 528 F.2d 564 (5th Cir., 1976).

A prima facie case of respondent knowledge, and, therefore, of a respondent violation,was established by the Secretary. Marvin Fowler was ostensibly in charge of the three other boys in the absence of Foreman Kaiser. And it is reasonble to conclude that Mr. Fowler was vested with sufficient authority to assure that the pipe moving operation was completed successfully, safely, and in accordance with prescribed procedure. See Iowa Southern Utilities, 77 OSAHRC 32/C10, 5 BNA OSHC 1138, 1977-78 CCH OSHD para. 21,612 (No. 9295, 1977). Certainly, Marvin Fowler (as well as the other boys) had knowledge

of the violative condition. He was present and an active participant in raising the pipe on end in order to remove the gopher from the pipe. Because he was acting in a supervisory role, his knowledge is imputable to respondent.

The crucial question, is: Does the evidence rebut the Secretary's prima facie case? This Judge believes it does.

Respondent issued specific instructions (not general, as contended by the Secretary) on numerous occasions to its employees not to raise pipes on end in the vicinity of power lines, and instructed these employees to follow the non-hazardous procedure of flushing the pipe lines whenever animals were encountered. These instructions were adequately communicated and had been carried out by these employees prior to June 10th. There is no indication that the employees had ever disobeyed or deviated from these instructions. Pat Whelan, age 16, and the only member of the group involved in the June 10th accident to testify, acknowledged he understood from Foreman Kaiser's instructions that he "shouldn't be lifting pipe up on end around power lines" (Tr. 82, 87). He also agreed that he had been instructed to flush out animals whenever he saw one (Tr. 88).

Because specific safety instructions and workrules concerning the hazard peculiar to the task being performed had been issued by respondent to Marvin Fowler, the "senior" employee, and to the other three boys, and Foreman Kaiser had not observed any infractions of these rules, this Judge is persuaded that respondent established by a preponderance of the evidence that it had implemented, prior to June 10th,

an adequate safety program with respect to handling irrigation pipe in the vicinity of power lines. Respondent, therefore, did not violate the general duty clause. See Ira Holliday Logging Co., Inc., 73 OSAHRC 16/A2, 1 BNA OSHC 1200, 1971-73 CCH OSHD para. 15, 688 (No. 237, 1973).

Citing Danco Construction Co., 1977-1978 OSHD para. 22,280, (No. 12847, October 25, 1977) the Secretary contends that the young ages of the workers necessitated additional instructions. But this was a simple not a complex operation that had been performed by these boys hundreds of times. More importantly, there is no indication that any of these boys, because of their youth, were incapable of understanding the specific instructions which would have totally eliminated the hazard, or were unaware of the attendant hazards if these instructions were disregarded. To the contrary, Pat Whelan testified he understood the import of the instructions.

For the foregoing reasons, the citation and proposed penalty must be vacated.

## CONCLUSIONS OF LAW

1. Respondent is an employer engaged in a business affecting interstate commerce.

2. The Secretary of Labor's inspection of June 15, 1977, did not contravene respondent's Fourth Amendment rights.

3. On June 10, 1977, respondent was not in violation of 29 U.S.C. §654(a)(1).

## ORDER

Based on the foregoing findings, conclusions of law, and the entire record, it is ORDERED:

1. The citation issued to respondent on June 24, 1977, and the proposed penalty based thereon, is VACATED.

## DECISION

Before: ROWLAND, Chairman; CLEARY and COTTINE, Commissioners.

BY THE COMMISSION:

The Secretary of Labor ("the Secretary") issued to Chesapeake Operating Company ("Chesapeake") a citation alleging that Chesapeake had willfully violated two longshoring safety standards. Administrative Law Judge Joseph L. Chalk vacated one item of the citation and affirmed the other as a non-serious, rather than willful, violation. The Secretary petitioned for review of the judge's decision as to both items, and Commissioner Cleary directed review under 29 U.S.C. § 661(i), section 12(j) of the Occupational Safety and Health Act of 1970, 29 U.S.C. §§ 651-678 ("the Act"), on all issues raised in the Secretary's petition, including:

> 1. Whether the administrative law judge erred by concluding that the standard at 29 CFR §1918.32(b) does not apply to cargo stowed on the deck of a ship; and
>
> 2. Whether the administrative law judge erred by concluding that Chesapeake Operating Company did not commit a willful violation . . . because the failure to comply with the standard at 29 CFR §1918.105(a) was caused by a non-supervisory employee.

I

The first item of the citation alleged a willful violation for failure to comply with 29 C.F.R. § 1918.32(b), which states:

> § 1918.32 Stowed cargo and temporary landing platforms.
>
> * * *
>
> (b) When an edge of a hatch section or of stowed cargo more than 8 feet high is so exposed that it presents a danger of an employee falling, the edge shall be guarded by a safety net of adequate strength to prevent injury to a falling employee, or by other means providing equal protection under the existing circumstances.

Chesapeake, a stevedoring company operating in Baltimore, Maryland, had two gangs of nineteen employees each loading parts of modular homes onto a ship. Since the employees had filled all the holds on the ship that would accommodate the modules, they were loading them on the deck. The slanted roofs of the modules were covered with snow and ice, and Chesapeake had employees working on top of the modules clearing away the snow. At the time of the alleged violation, these employees had no fall protection; an employee could have fallen from the roof of one of the modules to the pier or the water 40 feet or more below.

After the hearing, Chesapeake submitted a motion to supplement the record with a copy of a letter written by Edward C. March of the Office of Maritime Standards of OSHA to an official of the Oregon Area Accident Prevention Committee, Pacific Maritime Association. The letter stated in part:

> This is in response to your letter of June 22, 1977 relative to the intent of Sections 1918.32(b) and 1918.54(f) of 29 CFR Part 1918. Frankly, we are surprised at the need for such advice at this time as these regulations have been in effect for many years and a record search indicates only one prior instance in the case of each of these rules when some sort of interpretation was required.
>
> Section 1918.32(b) was developed to handle circumstances when men were required to work either at the edge of a partially opened hatch section or of a block or unit of stowed cargo in a hold under the circumstances described. It is meant to apply only to those "hold" situations, and not to deck cargo situations, that matter specifically coming under section 1918.33.
>
> * * *

This reply has been coordinated with our Directorate of Compliance who are responsible for the dissemination of interpretations, and who concur.

A

Judge Chalk found that the standard does not apply to deck cargo and vacated this item. He held that section 1918.33 1/ governs cargo carried on the deck, while section 1918.32 applies only to cargo stowed below decks. The judge denied Chesapeake's motion to supplement the record even though the Secretary had not objected to it. He reasoned that, because the question could be resolved without the proffered evidence, 2/ it was more expeditious to deny the motion than to reopen the hearing to afford the Secretary an opportunity to object to the letter or to submit rebuttal evidence.

The Secretary argues that the judge erroneously interpreted the standard and that section 1918.32(b) does apply to cargo on deck as well as in the hold. Chesapeake argues that the judge's interpretation is correct and is consistent with the maritime industry's understanding of the term "stowed cargo." Citing Mr. March's letter, Chesapeake maintains that the applicability of section 1918.33

---

1/ That section provides:

§ 1918.33 Deck loads.

(a) Employees shall not be permitted to pass fore and aft over or around deck loads unless there is a safe passage.
(b) Signalmen shall not be permitted to walk over deck loads from rail to coaming unless there is a safe passage. If it is necessary to stand at the outboard or inboard edge of the deckload where less than 24 inches of bulwark, rail, coaming, or other protection exists, any signalman shall be provided with a suitable means of protection against falling from the deck load.

2/ The judge relied on the plain wording of the standard. In addition to concluding that cargo on deck is expressly governed by section 1918.33, he read section 1918.32(b) together with section 1918.32(c), which refers to employees working on different levels "in the same hatch." Accordingly, he concluded that the entire section 1918.32 is intended to apply only to cargo stowed in the holds of ships.

to deck loads indicates that section 1918.32 does not apply to deck loads, and argues that under both the Occupational Safety and Health Act and the Longshoremen's and Harbor Workers' Compensation Act ("LHWCA"), section 1918.32(b) has consistently been interpreted to apply only to hold cargo.

B

After Judge Chalk issued his decision, the Commission fully considered this issue in Seattle Crescent Container Service, 79 OSAHRC 91/A2, 7 BNA OSHC 1895, 1979 CCH OSHD ¶ 24,002 (No. 15242, 1979), and unanimously interpreted section 1918.32(b) as applicable to cargo carried on the deck of a ship. That decision is controlling here.

In Seattle Crescent, a copy of the letter by Mr. March was submitted to the Commission while the case was on review, and the Commission denied the employer's motion to supplement the record. Here, the letter was submitted to the judge, who denied the motion because he found the letter unnecessary to his conclusion. In this case, however, we are confronted with a Commission precedent that is contrary to the judge's interpretation. Chesapeake has in effect renewed its motion by referring to the March letter in its brief in opposition to the Secretary's petition and in its brief on review. The Secretary has not objected to Chesapeake's references to the letter even though he moved to strike statements made in Chesapeake's reply brief, and he has not sought the opportunity to present evidence to rebut Mr. March's letter. We will therefore consider the motion to admit the letter.

Motions to reopen the record and receive additional evidence are not precisely covered by the Federal Rules of Civil Procedure. See Caracci v. Brother International Sewing Machine Corp., 222 F. Supp. 769 (E.D. La. 1963), aff'd per curiam, 341 F.2d 377 (5th Cir. 1965); 6A Moore's Federal Practice ¶ 59.04[13] (1979). Professor Moore has observed:

> In passing on the motion, the time when the motion is made, the character of the additional testimony, and the effect of granting the motion are pertinent factors for consideration.
>
> * * *
>
> A [trial] court, then, should consider a motion to reopen to take additional testimony in light of all the surrounding circumstances and grant or deny it in the interest of fairness and substantial justice.

6A Moore's Federal Practice, at pp. 59-33, 59-36. We are of the opinion that the interests of fairness, substantial justice, and adjudicative efficiency would be better served by our considering the letter now, rather than fostering the uncertainty and litigation that could ensue if we awaited a case in which the letter was admitted.

Mr. March's interpretation conflicts with that of the Secretary in this case and in Seattle Crescent. Mr. March did not state that the term "stowed cargo" was used in any particular sense, and he supplied no reasons or authority for his interpretation. His letter constitutes merely an informal advisory opinion, which is not binding on either the Secretary or the Commission. See Bethlehem Steel Corp., 81 OSAHRC 108/A2, 10 BNA OSHC 1264, 1981 CCH OSHD ¶ 25,839 (No. 16067, 1981). Cf. Holman Erection Co., 77 OSAHRC 196/A2, 5 BNA OSHC 2078, 1977-78 CCH OSHD ¶ 22,318 (No. 13529, 1977)(opinions of compliance officers cannot bind Secretary or Commission). Having considered Mr. March's letter, we find nothing in it that convinces us to change our fully-considered interpretation in Seattle Crescent.

Nor are we persuaded by the argument that deck cargo is governed exclusively by section 1918.33. Although the caption of section 1918.33 indicates that it applies to deck cargo, we look primarily to the standard itself rather than its caption to determine its scope. See Wray Electrical Contracting, Inc., 78 OSAHRC 78/A2, 6 BNA OSHC 1981, 1978 CCH OSHD ¶ 23,031 (No. 76-119, 1978), aff'd, 633 F.2d 220 (6th Cir. 1980). Section 1918.33 has a very narrow scope. Neither part of section 1918.33 applies to the working condition cited here: Chesapeake's employees were not signalmen and are therefore not covered by section 1918.33(b);

and section 1918.33(a) does not apply because the employees were on the modules working to clear away ice and snow, not traveling over or around them. Because no more specific standard applies to the working condition cited here, section 1918.32(b) applies. See 29 C.F.R. § 1910.5(c); Brown & Root, Inc., 81 OSAHRC 44/A2, 9 BNA OSHC 1833, 1981 CCH OSHD ¶ 25,366 (No. 76-190, 1981); Bristol Steel & Iron Works, Inc. v. OSHRC, 601 F.2d 717 (4th Cir. 1979). We therefore reaffirm Seattle Crescent's holding that section 1918.32(b) applies to cargo carried on the deck of a ship.

C

Although Commissioners Cleary and Cottine find that the standard applies, Commissioner Cleary concludes that this item of the citation should nevertheless be vacated. 3/ Commissioner Cleary finds that Mr. March's letter gives credence to Chesapeake's argument that the maritime industry was not aware that section 1918.32(b) applied to cargo stowed on deck when the violation occurred. Due process of law requires that an employer must have notice of what is required by a standard before a violation can be found. See Diebold, Inc. v. Marshall, 585 F.2d 1327, 1335-37 (6th Cir. 1978). Commissioner Cleary finds that Chesapeake lacked sufficient notice of the requirements of section 1918.32(b). He therefore votes to vacate this item. Commissioner Cleary emphasizes that this disposition does not relieve employers from their obligation to comply with section 1918.32(b), since the Commission has held that the standard applies to cargo stowed on deck. Id. at 1338.

Chairman Rowland also votes to vacate this item. For the reasons stated in his separate opinion, he agrees with Judge Chalk's finding that section 1918.32(b)

---

3/ Commissioner Cottine's individual views on the proper disposition of this item are set forth in his separate opinion.

does not apply to the cited working conditions. The judge's vacation of this item is therefore affirmed. 4/

II

The second item of the citation alleged a willful violation of 29 C.F.R. § 1918.105(a), which requires that employees be protected by protective hats. 5/ When the compliance officer arrived at the site, he noticed three employees working without hardhats. The judge found a violation but concluded that it was not willful. The Secretary petitioned for review of the judge's finding that the violation was not willful. Chesapeake concedes that there was a violation but argues that it was not willful. We agree.

A

When work began on the morning of the inspection, one of Chesapeake's crews was seven employees short. At the gang leader's request, Chesapeake requested that seven more workers be sent from the union hiring hall. When these workers arrived, sometime between nine and ten o'clock that morning, none of them had a hardhat. The gang leader realized that the employees needed hardhats, so he went to the ship foreman, Dave Bogdan, to request hardhats.

---

4/ The Secretary argues in his brief that if the cited standard does not apply, the pleadings should be amended under Rule 15(b) of the Federal Rules of Civil Procedure to allege a violation of § 5(a)(1) of the Act, 29 U.S.C. § 654(a)(1). Because a majority of the Commission holds that the standard does apply, amendment to § 5(a)(1) is inappropriate. Brisk Waterproofing Co., 73 OSAHRC 30/E1, 1 BNA OSHC 1263, 1973-74 CCH OSHD ¶ 16,345 (No. 1046, 1973). Accordingly, we need not reach Chesapeake's argument that the amendment to § 5(a)(1) may not be granted because it was not raised before the judge. Cf. Commission Rule 92(d), 29 C.F.R. § 2200.92(d)(Commission review ordinarily limited to issues raised below).

5/ That standard provides:

> § 1918.105 Head protection.
>
> (a) Employees shall be protected by protective hats meeting the specifications contained in the American National Standard Safety Requirements for Industrial Head Protection, Z89.1 (1969).

Bogdan replied that he would get the hardhats but instructed the employees to work without them in the meantime. When the compliance officer arrived about 1:30 p.m., the employees still had not been given hardhats. The compliance officer asked Bogdan why he had not gotten hardhats for the employees, and Bogdan replied that he had not had time.

The compliance officer testified that he had been at the marine terminal the two days immediately before the inspection for another purpose and had not then inspected Chesapeake's workplace. On both days, however, he had noticed Chesapeake employees working without hardhats and had stopped at Chesapeake's offices each day to relate his observations. The compliance officer also testified that Chesapeake had received two prior citations for violating section 1918.105(a), both of which had become final orders.

The witnesses generally agreed that longshoremen resist wearing hardhats and that the requirement to do so is difficult to enforce. Chesapeake has numerous signs posted around its work areas reminding employees to wear hardhats, frequently reminds its supervisors to enforce Chesapeake's hardhat rule and has sent employees home for refusing to wear hardhats. Every Chesapeake supervisor is given a copy of the OSHA regulations and is told to enforce them.

Chesapeake presented evidence that Bogdan had recently been hired as a foreman through the union, which apparently selected Bogdan because he was the senior applicant for the position. Bogdan was still in his probationary period at the time of the inspection and was restricted to supervising the work on the dock because Chesapeake did not trust him on the ship. On board the loading was supervised by Bogdan's superior, the ship superintendent, who immediately ordered hardhats for the employees when he was informed of the situation.

A week or two before the inspection, Bogdan had attended a meeting of all supervisory personnel at which the hardhat rule and problems with its enforcement were discussed. During that meeting, the gang leader who would later ask Bogdan

to get hardhats for the employees inquired, "[I]f I send a man home for not wearing a hardhat, who would pay this man when he came back— . . . When the union delegate comes to me and says I've got to pay this man, who's going to back me up?" He was told that, "Yes, the company would back him to the fullest." At the end of his probationary period, Bogdan was fired, largely for, among other things, his poor safety record, including the incident in question here.

B

The judge found that Bogdan was "not a foreman in the ordinary sense of the word," but was a "trainee-foreman." He held that Bogdan's conduct could not be imputed to Chesapeake because Bogdan was not the supervisory employee in charge of the worksite. Judge Chalk found that the ship superintendent had no actual knowledge of the violation but that he had constructive knowledge because he could have observed the situation with the exercise of reasonable diligence. However, he determined that the ship superintendent's conduct was not willful in nature.

On review, the Secretary argues that Bogdan's actions should be imputed to Chesapeake because he was a supervisor. In order to defend on the ground that a supervisor's misconduct was unforeseeable, the Secretary asserts, the employer must prove that the supervisor was adequately trained and supervised on matters of safety. The Secretary argues that Chesapeake should be held responsible because its workrule was inadequately enforced, asserting that an employee caught without a hardhat would merely be told to wear the hardhat without being subject to any punishment. According to the Secretary, an employee would be disciplined only if he refused to obey such an instruction from a supervisor, and the Secretary further claims that no supervisor had ever been punished for failing to enforce the rule. Finally, the Secretary asserts that Bogdan's misconduct should be imputed because Chesapeake's hiring practices were inadequate, in that Bogdan was hired and placed in charge of 40 to 50 employees with no check

on his past work history. The Secretary does not dispute the judge's conclusion that the violation cannot be found willful based on the conduct of the ship superintendent.

Chesapeake argues that Bogdan's actions should not be imputed because he was not a true foreman and had limited responsibility in view of his probationary status. Chesapeake also contends that Bogdan's conduct in any event was unforeseeable behavior for which Chesapeake cannot be held responsible. Chesapeake maintains that longshoremen resist wearing hardhats, that the requirement is difficult to enforce, and that Chesapeake has made diligent efforts to obtain compliance with its rule requiring hardhats to be worn. 6/

C

For the reasons below, we affirm Judge Chalk's finding that the violation was not willful. We find that, even if Bogdan had been a supervisor and even if his conduct had been willful, Chesapeake did not commit a willful violation because it did everything it could to enforce its workrule requiring that hardhats be worn.

Conduct is considered willful if it was done with either intentional disregard or plain indifference to the requirements of the Act. Lukens Steel Co., 81 OSAHRC 96/A2, 10 BNA OSHC 1115, 1981 CCH OSHD ¶ 25,742 (No. 76-1053, 1981). The Commission has held that a supervisor's willful violation will be imputed to his employer unless the supervisor's behavior was contrary to a consistently and adequately enforced workrule. See Constructora Maza, Inc., 78 OSAHRC 6/E2, 6 BNA OSHC 1309, 1312, 1977-78 CCH OSHD ¶ 22,487, p. 27,115 (No. 13680, 1978).

---

6/ Because we find that Chesapeake adequately enforced its rule requiring that hardhats be worn, it is unnecessary here for Chairman Rowland to examine whether Commission precedent is correct insofar as it requires employers to enforce as well as communicate work rules. For a discussion of whether an employer should be required to do anything more than instruct employees on safety procedures, see General Electric Co. v. OSHRC, 540 F.2d 67, 69 (2d Cir. 1976); Borton, Inc., 82 OSAHRC _____, 10 BNA OSHC 1462, 1982 CCH OSHD ¶ 25,983 (No. 77-2115, 1982)(dissenting opinion).

The record shows that Bogdan's behavior was untypical of Chesapeake's supervisory personnel. Chesapeake had a rule requiring the use of hardhats, communicated it by signs around the workplace, reminders in the pay envelopes and other means, and vigorously enforced it in the face of the employee opposition. The gang leader for example, respected the rule, for he attempted to obtain hardhats for the employees as soon as they reported to him. Bogdan was aware that the company expected its supervisors to enforce its hardhat rule and would stand behind them. His behavior on this occasion was not shown to be common among Chesapeake's supervisors. Bogdan was disciplined for this incident in that his dismissal was based partly on this misconduct. 7/ Although Chesapeake might have checked Bogdan's work record before placing him in charge of so many employees, this hardly shows, in view of the other evidence, that Chesapeake intentionally disregarded or was plainly indifferent to the requirements of the Act. Accordingly, the judge's vacation of the "willful" characterization of the violation is affirmed.

D

In his petition for discretionary review, the Secretary moved to amend the pleadings under Federal Rule 15(b) to allege that the violation was repeated if it is not found to be willful. The motion was renewed in his brief.

At the hearing the compliance officer testified that Chesapeake had received two prior citations at this terminal for noncompliance with section 1918.105(a). This testimony was presented to show that Chesapeake was aware of the requirements of the standard, which is relevant to the willful characterization. Chesapeake introduced copies of these two prior citations for the purpose of showing that

---

7/ The Commission has considered evidence of discipline imposed after an inspection in determining whether an employer has effectively enforced its workrules. See R. Zoppo Co., 81 OSAHRC 18/A2, 9 BNA OSHC 1392, 1396 n.7, 1981 CCH OSHD ¶ 25,230, p. 31,184 n.7 (No. 14884, 1981); Asplundh Tree Expert Co., 78 OSAHRC 77/E12, 7 BNA OSHC 2074, 1980 CCH OSHD ¶ 24,147 (No. 16162, 1979).

hardhat violations have previously been cited as other than serious and that no penalty or a small penalty has been proposed for them in the past. No allegation was made before or during the hearing that the violation was repeated within the meaning of section 17(a), and there is no indication that the parties considered the evidence to relate to matters other than willfulness.

Under these circumstances, Chairman Rowland would deny the motion to amend. In his view, it is enough to note that the parties did not recognize at the hearing that they were trying the issue of whether the violation was repeated. See Crawford Construction Co., 82 OSAHRC 16/A2, 10 BNA OSHC 1522, 1527, 1982 CCH OSHD ¶ 25,984, p. 32,607 (No. 79-928, 1982)(dissenting opinion). As Chairman Rowland has stated:

> A litigant has the right to fair notice of the issues to be tried, so that he can adequately prepare and present his case. Pleadings may therefore be amended under Rule 15(b) only when the parties recognize that they are trying unpleaded issues. "[I]t cannot be fairly said that there is any implied consent to try an issue where the parties do not squarely recognize it as an issue in the trial." 3 Moore's Federal Practice ¶15.13[2] at 992 (2d ed. 1974), quoted in Usery v. Marquette Cement Manufacturing Co., 568 F.2d 902, 907 (2d Cir. 1977). See Vicon Corp., 81 OSAHRC 98/C4, 10 BNA 1153, 1158, 1981 CCH OSHD ¶25,749, p. 32,160 (No. 78-2923, 1981)(concurring opinion), appeal filed, No. 81-2359 (8th Cir. December 10, 1981).
>
> * * *
>
> [I]n my view it is unrealistic and unfair to expect an employer to anticipate every unpleaded charge which the Secretary might subsequently attempt to inject into the case. It is equally unfair to require the employer to attempt to limit the purpose for which evidence is adduced in order to avoid the implication of consent to try issues raised after the close of the hearing.

Snyder Well Servicing, Inc., 82 OSAHRC 10/C5, 10 BNA OSHC 1371, 1380-81, 1982 CCH OSHD ¶ 25,943, pp. 32,515-16 (No. 77-1334, 1982)(dissenting in part).

Commissioner Cleary would also deny the motion to amend. He notes that to establish that a violation is repeated, the Secretary must show that the employer had previously been cited for substantially similar violation and that the earlier citation had become a final order before the violation in question

occurred. See Potlatch Corp., 79 OSAHRC 6/A2, 7 BNA OSHC 1061, 1063, 1979 CCH OSHD ¶ 23,294, p. 28,171 (No. 16183, 1979). The Secretary can establish substantial similarity by showing that the prior and the current violation resulted from noncompliance with the same standard. Once this prima facie showing has been made, the burden of rebutting that showing shifts to the employer. See Chapman Construction Co., 80 OSAHRC 122/D9, 9 BNA OSHC 1175, 1177, 1981 CCH OSHD ¶ 25,024, p. 30,928 (No 76-2677, 1980).

Pleadings are to be amended under Rule 15(b) if an unpleaded issue has been tried with either the express or the implied consent of the parties. The Commission has held that consent will be implied where the party opposing the amendment will not be prejudiced by the amendment and has either introduced evidence relevant to the unpleaded issue or failed to object to such evidence. If the amendment would not be prejudicial, it makes no difference that the evidence is relevant both to the unpleaded issue and to a pleaded issue. See Crawford Construction Co., 10 BNA OSHC at 1525, 1982 CCH OSHD at pp. 32,605-06 (lead opinion).

Although the two prior citations and the present citation all allege a violation of the same standard, Commissioner Cleary cannot say that the parties focused on substantial similiarity. The two prior citations indicate that the conditions cited took place in the holds of ships, while the violation here occurred on the pier. The record does not disclose what the cargo was at the time of the prior violations or whether the cargo was being loaded or unloaded. Except that one of the prior citations alleged that employees were exposed to "falling debris," there is no evidence as to what hazards of head injury Chesapeake's employees were exposed to. Given the sparseness of the record on the issue of substantial similarity, the parties' failure to focus on the issue, and the prospect that additional evidence might have been presented if the repeated allegation had been pleaded, Commissioner Cleary cannot say that Chesapeake would not be prejudiced. Cf. Mississippi Power & Light Co., 79 OSAHRC 109/D12,

7 BNA OSHC 2036, 2040-41, 1980 CCH OSHD ¶ 24,146, pp. 29,341-42 (No. 76-2044, 1979)(parties did not recognize issue during hearing and did not present evidence; prejudice found).

Finally, under the circumstances here, Commissioner Cleary would not remand this case to cure any possible prejudice. He notes that only the characterization of the violation and the amount of the penalty would be affected. Because of the policy favoring finality in adjudication he would decline to remand. See Daniel Construction Co., 81 OSAHRC 71/A2, 9 BNA OSHC 2002, 2007, 1981 CCH OSHD ¶ 25,553, p. 31,864 (No. 13874, 1981), quoting Texaco, Inc., 80 OSAHRC 68/A2, 8 BNA OSHC 1677, 1679, 1980 CCH OSHD ¶ 24,574, p. 30,146 (No. 77-2014, 1980). He would therefore deny the motion to amend.

Accordingly, the Secretary's motion to amend the pleadings to allege a repeated violation is denied.

III

Judge Chalk considered the factors mandated by section 17(j) of the Act, 29 U.S.C. § 666(i), and found that a penalty of $50 was appropriate for the hardhat violation. Neither party has disputed that $50 is an appropriate penalty if the violation is not found to be willful, and the assessment appears to be appropriate.

Accordingly, item 1 of the citation, is vacated. Item 2 is affirmed as an other than serious violation; a penalty of $50 is assessed.

SO ORDERED.

FOR THE COMMISSION

Ray H. Darling, Jr.

Ray H. Darling, Jr.
Executive Secretary

DATED: JUN 30 1982

ROWLAND, Chairman, concurring in part and dissenting in part:

I agree with the finding in Part II C of the lead opinion that Chesapeake did not willfully violate the hardhat standard and with the denial in Part II D of the Secretary's motion to amend the pleadings to allege that the hardhat violation was repeated. I also join with Commissioner Cleary in vacating the citation alleging a violation of section 1918.32(b), but I do so for a different reason. I agree with Judge Chalk that section 1918.32(b) does not apply to cargo carried on deck, and I further agree with the judge that the issue of applicability may be decided without regard to the letter of Mr. March. Therefore, I do not join in Part I B of the lead opinion regarding the admissibility and evidentiary value of the letter.

Although the term "stowed cargo" is not defined in Part 1918, section 1918.32 and other provisions of Part 1918 plainly indicate that "stowed cargo" does not refer to deck loads. First, the sense of section 1918.32 itself is that stowed cargo is cargo carried below deck. Section 1918.32 addresses two matters: stowed cargo (in paragraphs (b) and (c)) and temporary landing platforms (in paragraph (a)). Inasmuch as paragraph (c) deals only with fall protection with respect to cargo carried below deck, I agree with Judge Chalk that when paragraphs (b) and (c) are read together, the inference is raised that the stowed cargo provisions refer to cargo carried below deck.

Second, it is evident from reading the maritime standards together that they use maritime terminology and words in their maritime senses. This is understandable, for the standards were written for maritime employers to comprehend and follow. I therefore find it significant that the only definition of "stow" referring specifically to cargo in R. Kerchove, International Maritime Dictionary 795 (2d ed. 1961), is "to arrange compactly the goods or cargo in a ship's hold, and 'tween decks." The other definitions ("to furl or roll up as a

sail, an awning, and so forth" and "to put anything away for sea[; t]o put gear in its proper place") are more general, do not deal with cargo, and are therefore less pertinent. I also note that in L. Probst & K. DeGross, Transportation Dictionary 106 (1979), "stowage" is defined as "a marine term referring to the loading of freight into a vessel's hold." Indeed, the majority's broader definition in Seattle Crescent makes the word "stowed" superfluous, for all cargo is somehow put away on a ship and transported.

Third, Judge Chalk pointed out here what the Commission overlooked in Seattle Crescent: There is a standard in Part 1918 specifically dealing with the hazard of falling from deck loads--section 1918.33, which is entitled "Deck loads." That section 1918.33 deals specifically with falling from deck loads signifies that section 1918.32 does not, since the use of different terminology in the standards is evidence that the Secretary made an intentional distinction. See Lankford v. LEAA, 620 F.2d 35 (4th Cir. 1980); United States v. Wong Kim Bo, 472 F.2d 720 (5th Cir. 1972). The majority's interpretation makes section 1918.33 superfluous and gives unintended breadth to section 1918.32.

The majority's reasons for dismissing the importance of section 1918.33 are specious. That section 1918.33 does not require fall protection in the particular circumstances of this case is beside the point. What is critical here is that section 1918.33 addresses the subject of falling from deck loads; whether it is sufficiently stringent to cover this case is not an appropriate inquiry. John T. Brady & Co., 82 OSAHRC 9/D10, 10 BNA OSHC 1385, 1386-7 n.7, 1982 CCH OSHD ¶ 25,941, p. 32,503 n.7 (No. 76-2894, 1982)(view of Chairman Rowland). See also Daniel Construction Co., 82 OSAHRC 23/A2, 10 BNA OSHC 1549, 1555, 1982 CCH OSHD ¶ 26,027, p. 32,675 (No. 16265, 1982). Section 1918.33 represents the considered judgment of the Secretary, arrived at after receiving the views of safety experts and affected persons, that protection from the hazard of falling

from deck loads is warranted in some circumstances and unwarranted in others. See Daniel International, Inc., 82 OSAHRC 23/D3, 10 BNA OSHC 1556, 1558-59, 1982 CCH OSHD ¶ 26,033, p. 32,683 (No. 78-4279, 1982); A. Prokosch & Sons Sheet Metal, Inc., 80 OSAHRC 96/A2, 8 BNA OSHC 2077, 2082, 1980 CCH OSHD ¶ 24,840, pp. 30,629-30 (No. 76-406, 1980). To stretch section 1918.32 to cover gaps deliberately left by the Secretary is to negate that judgment. It is for the Secretary, not the Commission, to determine whether and how the gaps ought to be filled. Improvements to employee safety and health should not be accomplished by a strained interpretation of a standard. See Berglund-Cherne General Contractors, 82 OSAHRC 25/D9, 10 BNA OSHC 1644, 1646, 1982 CCH OSHD ¶26,039, p. 32,696 (No. 79-4374, 1982).

It was stated in Seattle Crescent that the emergence of containerized cargo has caused major adjustments in cargo transportation and longshoring operations since this standard was originally adopted under the Longshoremen's and Harbor Workers' Compensation Act, 33 U.S.C. § 901-950. If this is so, the standard may need revision. But it is not the role of the Commission to modernize the Secretary's standards. "The responsibility to promulgate clear and unambiguous standards is upon the Secretary." Bethlehem Steel Corp. v. OSHRC, 573 F.2d 157, 161 (3d Cir. 1978). I would therefore overrule Seattle Crescent and vacate this item of the citation.

COTTINE, Commissioner, dissenting in part:

I would affirm a violation of §1918.32(b) in this case and would find that Chesapeake's hardhat violation was willful.

I

The admission of Mr. March's letter in evidence does not warrant a different result in this case than in Seattle Crescent Container Service, 79 OSAHRC 91/A2, 7 BNA OSHC 1895, 1979 CCH OSHD ¶24,002 (No. 15242, 1979), where the Commission unanimously affirmed a violation. Administrative agencies are not estopped from protecting the public interest because of the past mistakes of their agents. University of Pittsburgh, 80 OSAHRC 12/C11, 7 BNA OSHC 2211, 2218 n. 32, 1980 CCH OSHD ¶24,240, p. 29,502 n. 32 (No. 77-1290, 1980); Udall v. Oelschlaeger, 389 F.2d 974 (D.C. Cir.), cert. denied, 392 U.S. 909 (1968); Spencer v. Railroad Retirement Bd., 166 F.2d 342 (3d Cir. 1948); N.L.R.B. v. Baltimore Transit Co., 140 F.2d 51 (4th Cir.), cert. denied, 321 U.S. 795 (1944). Thus, the Secretary is not estopped from enforcing an otherwise valid standard according to its terms because of a mistaken interpretation issued by one of his agents. Of course, a party who has actually relied in good faith on a mistaken interpretation should not be penalized, though compliance with the law must be required. See General Electric Co., 81 OSAHRC 42/A2, 9 BNA OSHC 1722, 1729, 1981 CCH OSHD ¶25,345, p. 31,455 (No. 13732, 1981) (Cottine, Commissioner, concurring in part and dissenting in part)(monetary penalties are inappropriate where the employer lacks knowledge of a violation, though an abatement order may be entered.) However, there is no evidence that Chesapeake knew about Mr. March's letter or the opinions expressed in it until after the hearing when Chesapeake submitted the

letter to the judge. Thus, there is no evidence that Chesapeake actually relied on Mr. March's letter in any way at the time of the alleged violation. As a result, Mr. March's letter does not affect this case.

There is no other due process bar to our applying the cited standard here as we did in Seattle Crescent. The standard is reasonably clear in its application to cargo stored on deck when read in light of the remedial purposes of the Act. The only maritime dictionary definitions of the word "stow" that have been urged in opposition to this view actually are consistent with it. See Seattle Crescent, supra.[1/] Thus, standing alone, §1918.32(b) gives a constitutionally adequate warning of its requirements.

---

1/ Chairman Rowland's reliance on maritime dictionaries to support his concurrence in this case is mistaken, just as was the employer's reliance on them in Seattle Crescent. The Chairman quotes from R. de Kerchove, International Maritime Dictionary 795 (2d ed. 1961), but one of the three definitions of "stow" there is "to put anything away for sea." This definition is consistent with applying the term to deck cargo, as we stated in Seattle Crescent. The term "stowage" is a different term whose connotations do not control the meaning of the word "stow." Thus, the definition of "stowage" in L. Probst & K. De Gross, Transportation Dictionary 106 (1979), quoted by Chairman Rowland, does not necessarily limit the meaning of "stow." Also, that definition contrasts with the definition of "stowage" in the International Maritime Dictionary:

> Stowage is that important branch of the art of seamanship which applies to the loading of a vessel and has for its aims the handling, placing and packing of goods, in such a manner as to ensure the preservation of crew and ship from danger and injury arising from the manner in which the cargo is stowed . . . .

Id. at 796. Nothing in that definition limits "stowage" to cargo below deck. It is erroneous to adopt a restrictive interpretation of the term "stow" where another reasonable interpretation is more consistent with the remedial purposes of the Act. See Seattle Crescent, supra.

Nor do any other factors preclude applying the standard to Chesapeake. The only factor cited by Commissioner Cleary is that "Mr. March's letter gives credence to Chesapeake's argument that the maritime industry was not aware that section 1918.32(b) applied to cargo stowed on deck when the violation occurred." Slip op., Part IC. However, Commissioner Cleary has not cited, and we have not found, any reference to this argument on review or before the judge. Furthermore, any argument that Chesapeake, or a reasonable person similarly situated, lacked fair notice of the standard's applicability to deck cargo is undermined by the fact that Chesapeake never raised that issue until after the hearing in this case when it submitted Mr. March's letter to the judge. Chesapeake's failure to raise the issue before becoming aware of the letter tends to indicate that the standard provided adequate notice of its requirements to Chesapeake. I would affirm the citation.

II

I would also conclude that the hardhat violation was willful. Bogdan, the ship foreman, had been placed in charge of 40 or more employees. He ordered some of the employees to work without head protection, knowing it to be a violation of the standard. This constitutes willful misconduct by a supervisor, and it is imputable to Chesapeake in this case.

A.

It is clear that Bogdan was a supervisor. The fact that he was still in his probationary period and had limited responsibilities does not outweigh the fact that Chesapeake placed him in charge of 40 to 50 employees. Although Bogdan was not the supervisor in charge of the entire worksite, he was nevertheless the sort of managerial employee whose acts and knowledge may be imputed to his employer. See Safeway

Stores, Inc., 77 OSAHRC 209/A13, 6 BNA OSHC 1176, 1977-78 CCH OSHD ¶22,400 (No. 14173, 1977)(produce manager was a supervisory employee); Georgia Electric Co., 77 OSAHRC 30/A2, 5 BNA OSHC 1112, 1977-78 CCH OSHD ¶21,613 (No. 9339, 1977)(assistant project manager and job superintendent both warned foreman of danger but foreman's willful disregard imputed to employer), aff'd, 595 F.2d 309 (5th Cir. 1979).

Chesapeake's reliance on the limited nature of the ship foreman's responsibilities is similar to that of the employer in Iowa Southern Utilities Co., 77 OSAHRC 32/C10, 5 BNA OSHC 1138, 1977-78 CCH OSHD ¶21,612 (No. 9295, 1977). There, the Commission held that a "temporary working foreman" who had some degree of authority over the other crew members, including the power to order those steps necessary to complete the job properly, was a supervisor. The Commission stated, "It is the substance of the delegation of authority over other employees that is of primary importance, and not the title of the employee to whom the authority is given." 5 BNA OSHC at 1139, 1977-78 CCH OSHD at p. 25,945. The ship foreman alone was entrusted with the responsibility for the loading operation being performed on the pier and is therefore a supervisor.

The ship foreman's conduct was willful. Under Commission precedent willfulness is established by conscious, intentional conduct that shows disregard for or plain indifference to the requirements of the Act. Kus-Tum Builders, Inc., 81 OSAHRC 97/B2, 10 BNA OSHC 1128, 1981 CCH OSHD ¶25,738 (No. 76-2644, 1981). Chesapeake knew of the standard's requirements because it previously had been cited under it and had been warned about noncompliance on other occasions. Chesapeake gave all of its supervisors, including the ship foreman, copies of the standards and communicated

the hardhat requirement in meetings, on signs throughout the workplace and in other ways. Also, it is clear that Bogdan knew that the law requires hardhats to be worn when he ordered the employees to begin working without them after the gang leader had requested additional hardhats. The record is replete with references to the opposition among longshoremen to wearing hardhats and to the controversy in the longshoring industry engendered by OSHA's enforcement of the hardhat requirement. As the senior applicant for the foreman's job, Bogdan was an experienced longshoreman familiar with the hardhat requirement.

B.

The willful misconduct of a supervisor is imputed to his employer unless the employer shows that the misconduct was contrary to a consistently and adequately enforced workrule. Constructora Maza, Inc., 78 OSAHRC 6/E2, 6 BNA OSHC 1309, 1977-78 CCH OSHD ¶22,487 (No. 13680, 1978). The majority erroneously focuses on whether Chesapeake, taken as a corporate entity, engaged in willful misconduct. It implicitly requires the Secretary to show that Bogdan's misconduct was a common occurrence among Chesapeake's supervisors. Inasmuch as Bogdan was a supervisor, the question is whether Bogdan's misconduct was willful and, if so, whether Chesapeake has shown that his misconduct should not be imputed to it.

Chesapeake has established that it had a workrule requiring that hardhats be worn and that it had adequately communicated the rule by a number of methods. However, the record indicates that the rule was not effectively enforced. Longshoremen regularly failed to wear hardhats. Nevertheless, the evidence indicates that Chesapeake did not discipline the longshoremen unless they were specifically ordered to wear hardhats and refused. This indicates inadequate enforcement as does the conduct

of the ship foreman. When Bogdan was informed by the gang leader that employees did not have hardhats, he issued instructions for the employees to begin work anyway. The majority nevertheless finds that Chesapeake's hardhat requirement was "vigorously enforced . . . in the face of employee opposition," citing the gang leader's conduct as demonstrating that Chesapeake's workrule was effectively communicated and enforced. It is much more significant, however, that the gang leader's superior felt free to instruct the employees to go ahead and violate the Act. "That a foreman feels free to breach a company safety policy is strong evidence that implementation of the safety policy is lax." Bill C. Carroll Co., 79 OSAHRC 87/C13, 7 BNA OSHC 1806, 1811, 1979 CCH OSHD ¶23,940, p. 29,033 (No. 76-2748, 1979). The fact that an employee in a position of responsibility thought that deviation from a safety workrule was acceptable conduct is persuasive evidence that a requirement to comply with the rule was not effectively enforced by the employer. See Western Massachusetts Electric Co., 81 OSAHRC 63/B13, 9 BNA OSHC 1940, 1945, 1981 CCH OSHD ¶25,470 at p. 31,766 (No. 76-1174, 1981).

Chesapeake argues that the ship foreman's lax behavior was not characteristic of its other supervisors' conduct. However, Chesapeake hired Bogdan for the job without any substantial check of his credentials. When Chesapeake finally inquired into his background, it received unfavorable reports. Chesapeake has not shown effective enforcement of safety rules where the record shows it hired a supervisor (even on a probationary basis) without determining his ability to perform the duties of his job, which include the enforcement of workrules designed to promote employee

safety.[2/] See National Realty & Construction Co. v. OSAHRC, 489 F.2d 1257, 1266-67 n. 37 (D.C. Cir. 1973). In view of this evidence, I cannot agree with the majority's finding that the rule was consistently and adequately enforced. Accordingly, because Chesapeake has not proven that the ship foreman's willful misconduct was unpreventable, that conduct is properly imputed to Chesapeake and the violation should be affirmed as willful.

---

2/ Chesapeake argues that because Bogdan was referred by the union, Chesapeake should therefore not be responsible for Bogdan's misconduct. In its reply brief on review, Chesapeake asserts that under its contract with the union involved, its foremen are selected by the union. The record does not reveal whether Chesapeake is contractually required to employ any individual selected by the union. However, even if the contract so provided, Chesapeake could not be permitted to contract away its legal obligations under the Act. Central of Ga. R.R. v. OSAHRC, 576 F.2d 620, 624 (5th Cir. 1978). An employer has responsibility for providing a safe and healthful workplace and delegation of that responsibility to employees is inconsistent with the purposes and policies of the Act. PBR, Inc., v. Sec'y of Labor, 643 F.2d 890, 895 (1st Cir. 1981); Empire Detroit Steel Division v. OSHRC, 579 F.2d 378, 385 (6th Cir. 1978); Atlantic & Gulf Stevedores, Inc. v. OSHRC, 534 F.2d 541, 553-54 (3rd Cir. 1976). Chesapeake was responsible for the adequacy of the ship foreman's safety training and for his conduct on the job.

| CHESAPEAKE OPERATING COMPANY | : | |
| Respondent | : | |

APPEARANCES

Agnes Johnson-Wilson, Esq.
For Complainant

William R. Dorsey, III, Esq.
James W. Bartlett, III, Esq.
For Respondent

DECISION AND ORDER

Chalk, Judge

The inspection of Respondent's Pier 4, Locust Point Marine Terminal worksite in Baltimore, Maryland, conducted after 1:00 p.m. on March 9, 1978, was occasioned by a telephone complaint of an employee earlier that day to the area director's office that some of Respondent's employees were in danger of falling and injuring themselves because they were working without the benefit of fall protection on ice and snow covered roofs of modular homes stowed on the deck of a ship. A two item willful citation was thereafter issued alleging violations of 29 U.S.C. 654(a)(2), as follows:

> "29 CFR 1918.32(b): The edge of a hatch section or of stored cargo, more than 8 feet high, presented the danger of employee(s) falling and was not guarded by a safety net of adequate strength to prevent injury to a falling employee or other means providing equal protection:

"M/V "Fort Calgary," Pier 4, Locust Point - Men were working on top of cargo (modular homes) that was covered with ice and snow above hatches 2, 3, 4, and 5."[1]

and

"29 CFR 1918.105(a): Employee(s) were not protected by protective hat(s) meeting the specification(s) contained in the American National Standards Safety requirements for Industrial Head Protection 289.1 (1969):

"M/V "Fort Calgary," Pier 4, Locust Point - Three (3) men, working on the pier adjacent to hatch #4 of the vessel attaching gear straps to modular home drafts, were not wearing hard hats."[2]

Penalties of $10,000 each were proposed for these charges, and immediate abatement was ordered.

---

1/ This standard provides:

"When an edge of a hatch section or of stowed cargo more than 8 feet high is so exposed that it presents a danger of an employee falling, the edge shall be guarded by a safety net of adequate strength to prevent injury to a falling employee, or by other means providing equal protection under the existing circumstances."

2/ This standard provides:

"Employees shall be protected by protective hats meeting the specifications contained in the American National Standard Safety Requirements for Industrial Head Protection, Z89.1 (1969)."

I

One issue initially raised in these proceedings in Respondent's notice of contest relates to "the procedures of the inspection." This issue was expanded upon in Respondent's answer to the complaint to include the compliance officer's failure to present his credentials, to conduct opening and closing conferences, to afford walkaround rights, and to furnish Respondent with a copy of the employee complaint. Later, in a motion to suppress the evidence, Respondent argued that the inspection was conducted without Respondent's consent and without a search warrant prescribed by the United States Supreme Court in Ray Marshall, Secretary of Labor, et al. v. Barlow's, Inc., 98 S.Ct. 1816 (1978).

In connection with this motion, Respondent requested a separate hearing; but I denied the request. Instead, I directed that evidence on the motion as well as on the merits be taken at the same hearing, assuring Respondent at the same time that its objection would be preserved and not waived by its participation in such procedure.

Another issue raised before and during the hearing goes to the merits of the case, as the parties were diametrically opposed as to whether the willful aspects of Complainant's charges were sustained by the evidence.

A final issue was raised by Respondent for the first time in its brief filed subsequent to the hearing. Relying upon the Judge's decision in Secretary v. Seattle Crescent Container Service, Docket Number 15242, May 16, 1977, Respondent asserts that the first charge must be vacated because the standard cited relates solely to cargo stowed in holds of ships, whereas the instant charge relates to cargo stowed on deck.

II

The modular homes in question are clearly depicted in four photographs taken by Compliance Officer Ellis from the pier after he arrived there to investigate the complaint (Exhs. C-1 to C-4). All four show some of these homes stowed lengthwise and in rows, one behind the other, on the deck adjacent to the pier below, with the downward slopes of the roofs all pointing to the edge of the deck. Three of the photographs each additionally show an employee on the roof of one of the homes in the first row adjacent

to the deck's edge (Exhs. C-1 to C-3). This first row appears to be stowed at the edge or very close to the edge of the deck. Additionally, two photographs collectively show three employees of the pier gang who were not wearing protective hard hats (Exhs. C-4, C-5).

Ellis arrived at the Locust Point Terminal about 1:15 p.m. to investigate the complaint received during the noon hour by his office. As the terminal was owned by the Maryland Port Authority, he gained admittance by reporting to the Port Authority's gate guard, showing this individual his credentials and explaining his mission. The guard offered to notify a Port Authority representative of the complaint and inspection, and such a representative later joined Ellis at the ship's berth.

The Port Authority rented space to the various stevedoring companies, including Respondent, that serviced the owners. Specifically, Respondent rented Pier 3, where it also had a warehouse facility housing its office. The "Pier 4 - Pier 5 complex" was rented by "Baltimore Stevedore" (Tr. 239). However, the head berth at the west side of Pier 4 "was a public berth and any stevedore [could] work there" (Tr. 240). The ship involved in the charges was located at this public berth at Pier 4.

Ellis testified that he saw both the employee slipping and sliding on ice and snow on the roof of a home stowed on deck and the three employees working on the pier without hard hats as he alighted from his car that he parked at the pier. There was no fall protection device in use to prevent the employee on the roof from sliding off and falling about 40 feet to the concrete pier below which, in Ellis' opinion, would have resulted in serious injury or death. The employees without hard hats were working around and even under the homes on the pier and the gear of the crane used to load the homes under such circumstances that they could have sustained head injuries.

According to Ellis, after determining that the ship foreman was one David Bogdon whom he knew from past employment, he approached Bogdon on the pier, showed him his credentials, pointed to the employee on the roof who was still slipping and sliding, and told Bogdon of the complaint that had been received. He asked Bogdon to stop the employee from doing what he

was doing and to order him off the roof. When Bogdon told him he did not have the authority to stop the work, he asked Bogdon to send word to the assistant general superintendent, a Mr. Amann, to come to the pier.

While awaiting the arrival of Amann, Ellis determined that the employees on the pier had been working without hard hats since early that day when Bogdon told them to start work and promised to furnish hats later, a promise that he had not kept. Later, Bogdon admitted these facts and told Ellis that he had been "busy and just didn't have time" (Tr. 21). When Ellis thereafter encountered Mr. Amato, the ship superintendent, who was serving in the capacity of ship foreman that day, and informed him of the hard hat problem, Amato immediately took action that resulted in the employees being promptly furnished hard hats.

Respondent's assistant vice president in charge of terminal and stevedoring operations, Mr. Hodski, Amann's superior, responded to Ellis' request that Amann come to the pier. According to Ellis, he showed Hodski his credentials, told him of the complaint, pointed out the ongoing operation on the roofs and asked him to remove the man from the roof. The reply, continued Ellis, was that there was no other way to clear the ice and snow from the roof. Ellis admitted that he did not suggest any alternate method of neutralizing the hazard that would permit the work to continue. He denied that he shouted or spoke in loud tones with Hodski during this encounter. On the contrary, he inferred that Hodski's tone "changed" and that he (Ellis) remained "firm but calm" (Tr. 84). At this point, Ellis expressed the desire to call his office, so he, Hodski, and the Port Authority representative proceeded to a nearby office.

Ellis spoke to Mr. Hill, the acting area director, over the telephone and told him that the complaint was a valid one. Then, at Hodski's request, he turned the telephone over to Hodski who immediately complained to Hill of Ellis' "attitude", stating that Ellis was "arrogant" (Tr. 85, 86). Ellis inferred from the conversation that followed between Hill and Hodski that Hill suggested the use of safety lines held by others on the deck. In any event, this method of abatement that would allow the work to proceed was agreed upon by Hill and Hodski; and Hill then directed Ellis to return to the ship to

see that the plan was carried out. There was no evidence of any further exposure of employees to the roof hazard after Hodski returned to the ship and his orders respecting the use of the safety lines were implemented.

Ellis testified that he recommended that the roof charge be alleged as willful because both Bogdon and Hodski refused "to abate or correct" the situation (Tr. 42). Several factors caused him to make a similar recommendation as to the hat charge. First when he was at the terminal on March 7, 1978 and again on March 8, 1978, on a matter not involving Respondent, he observed several of Respondent's employees working in the warehouse loading or unloading a truck and moving material around who were not wearing their hard hats (Tr. 46). He admitted, however, that these employees were "really" not exposed to any danger (Tr. 46, 47). He also admitted that stevedore employers had difficulty enforcing the hard hat rule, as employees did not like to wear the hats and they frequently removed them as soon as their supervisors were out of sight. In any event, on both occasions, he went to Respondent's office and gave Amann, on the first occasion, and Amann and Hodski, on the second occasion, a "friendly warning," and told them that no citation would be issued (Tr. 45). On the second occasion when Hodski was present, he refused to give Hodski the names of the employees so that he could fire them. He told Hodski that he did not "want to get anybody in trouble" (Tr. 67). Finally, he also considered the fact that Respondent had been cited twice before, in 1973 and 1975, for hard hat violations that had become final orders.

Ellis recommended a $10,000 proposed penalty for the roof charge and a $9,000 proposed penalty for the hard hat charge. However, according to Mr. Hill, the acting area director at the time, the hard hat proposal was increased to $10,000 because all willful charges emanating from his office had to propose such maximum penalty. He further explained:

> "These are orders that we have laid down for us first by the Area Director and then further on up. That part of it is out of my hands from that point. I just have to go by the rules and regulations that are laid down for me. . ." (Tr. 162).

Corroborating Ellis' testimony, Respondent adduced evidence that many employees did not like to wear hard hats and that they resisted wearing them. It also adduced extensive evidence that it strictly enforced its hard hat rule by sending employees home if they refused to wear hard hats, that signs reminding employees of the rule were posted in various places, that meetings attended by gang carriers, foremen, superintendents and higher officials, during which all supervisors were reminded of their duty to enforce the rule, were held every 4 to 6 weeks, and that some of the employees had in the past violently resisted the efforts of supervisors to get them to put on their hats (Exhs. R-9a thru 9f). In two safety meetings which the area director attended, one during August 1977, the other during January 1978, that official threatened willful charges and proposed penalties from $1,000 to $10,000, although he acknowledged the difficulty in enforcing the rule.

Amann and Amato both testified that the night before the inspection, they agreed on the use of lines tied to employees on the roofs and held by employees on the deck, when they started placing the homes on the deck the following morning. Amato also testified that he procured such lines that night, placed them in the sand box on the pier, and told both gang carriers that they were there and were to be used when needed. It was one of these gang carriers who phoned the complaint to the area director's office and it was unexplained as to why he did not use the lines or whether he know about them at the time. Finally, Amato testified that Ellis said nothing to him about the roof situation when he and Ellis met in the pier and Ellis showed him the men not wearing hard hats. Regarding the work on the roofs, he did not realize that the ropes were not in use as fall protection, as he told the gang carriers the night before to use them when it became necessary.

Amann testified that during the noon hour on the day of the inspection, he received a telephone call from someone who identified himself as Ellis who told him of the complaint.[3/] When he told this individual that they

3/ Ellis denied making the call.

were going to use sand on the roofs, the individual replied that such a measure should make the work safe but that he was coming to the pier to follow through on the complaint. Amann had talked to Ellis face to face on prior occasions and the individual sounded like Ellis. Amann also admitted that Bogdon should have furnished hard hats to the employees who did not have them and that Bogdon should have contacted Amato, who was on board the ship, when Ellis asked him to remove the employee from the roof.

It appears from the testimony of Amann and Hodski that Respondent's foremen are members of the union and that vacancies are filled from that source only, that Bogdon was a relatively new employee who was the senior member of the union who applied for the vacancy, that Respondent really had no background information on Bogdon when he was hired on a 90-day trial basis for the vacancy, and that he was subsequently discharged at the end of his probationary period when his conduct and efficiency deteriorated, apparently from the use of drugs. Amato had placed Bogdon on the pier to oversee the movement of the homes to the pier for loading on board the ship because he was "a new man and we couldn't trust him on the ship" (Tr. 270). According to Amato, Bogdon did not have the authority "to knock off the ship" (Tr. 270).

Hodski testified that when he entered his office on March 8, 1978, Ellis was there informing Amann of the men in the shed without hard hats. Hodski thought that Ellis' attitude on that occasion was improper, as he was sitting in a chair in "a slouched position" and greeted him (Hodski) rudely when he entered by asking "Who are you?" (Tr. 258). When he asked Ellis for the names of the two employees in the shed so that he could fire them "right now," Ellis' reply was that he was "not a bad guy" and that he "was not going to tell (Hodski) who the people were" (Tr. 259).

Concerning the day of the inspection, Hodski testified that when Bogdon came in the office and told Amann that Ellis wanted to see him at the pier "right now," Bogdon indicated that Ellis practically shouted those words. As Amann was busy at the time, Hodski went instead. As he approached Ellis, Ellis loudly proclaimed that he was "going to knock the ship off" (Tr. 243). At this point, Hodski, according to his testimony, had

said nothing and did not know what the problem was. The conversation between them grew into a shouting match.[4/] When Hodski became aware of the problem, he asked both Ellis and the Port Authority representative if they could suggest some means of protecting the employees short of stopping the work. When he received no reply, he suggested the use of lines, as discussed by the other witnesses. Ellis did not respond, but the Port Authority representative stated "Well, you are the expert" (Tr. 246).

Hodski's version of the telephone call did not differ materially from that of Ellis, except that Hodski testified that he, not Hill, suggested the use of the safety lines and that Hill agreed with the plan. He then returned to the ship and explained wha he desired to Amato. Up until this time, he was unaware of the prior plan of Amann and Amato to use safety lines.

III

Respondent's objections to the inspection in this case fall into two broad categories - failure to obtain either consent to search or a search warrant pursuant to Barlow's, supra, and failure to comply with the inspection procedures of 29 U.S.C. 657. The weight of authority does not support either objection.

Ellis gained access to the terminal premises by obtaining the permission of the gate guard, a representative of the owner, after explaining his mission and showing his credentials to him. In light of the rule that consent to search may be obtained from anyone who exercises control over the premises and is capable of giving consent, and that evidence obtained during the search that follows may be used against another, (United States v. Matlock, 415 U.S. 164, 94 S. Ct. 988 (1974)), Respondent lacks standing to complain on this ground.

---

4/ Amato observed the two on the pier from his position on the ship. While he could not hear what was said, he testified: "All I seen was hands going in the air and Joe pointing this way - - - Blah, blah, blah; I don't know what they were talking about" (Tr.279).

This was the same objection faced by the 8th Circuit in Marshall v. Western Waterproofing Company, Incorporated, 560 F.2d 947 (1977), wherein the Court stated:

> "We agree with the Commission that '[t]he compliance officers obtained permission to go onto the roof, the 5th floor mezzanine, and the attorney's office from persons who controlled those areas and were capable of giving such consent.' Accordingly, Western lacks standing to raise Fourth Amendment claims since valid consent to entry upon the relevant areas had been given by others who were in control."

As Ellis was lawfully on the premises and both of the conditions that served as the basis for the charges he recommended were in his full view as he alighted from his parked car, before he had the opportunity to encounter any of Respondent's representatives, the second prong of Respondent's objection is equally without merit (see generally Secretary v. Environmental Utilities Corp., 77 OSAHRC 40/A2). In any event, assuming that Ellis' actions constituted noncompliance with the inspection requirements of the Act, the citations in this case will not be vacated in the absence of prejudice to Respondent (Accu-Namics, Inc., v. Occupational Safety and Health Rev. Comm., 515 F.2d 828 (5th Cir., 1975); Marshall v. Western Waterproofing Co., Inc., supra). I am satisfied that no such prejudice has been demonstrated.

Lastly, Respondent argues for reversal because it was not furnished a copy of the employee complaint during the inspection. 29 U.S.C. 657(f)(1) does indeed provide for such a copy to be given the employer no later than at the time of the inspection. The statute also provides for eliminating from the employer's copy the name of the complaining employee, if the employee so requests.

In my judgement, however, these provisions of the statute are not addressed to the type of situation involved in this case where the area director responds to a telephone call reporting a condition that has every earmark of being an imminent danger situation that the area director would be remiss in not investigating forthwith. At most, the area director could not have had anything more than his own memorandum of the substance of the telephone call, the gist of which Ellis verbally made known to

Respondent's representatives at the time of the inspection. To argue that more was required by the statute in order to affirm the charges is to elevate form over substance to reach a result I am sure the Congress never intended. This I am not prepared to do; hence, the argument is rejected.

IV

Respondent's post hearing argument that the standard (29 C.F.R. 1918.32(b)) involved in item 1 of the citation is inapplicable to deck stowed cargo presents an important issue that was addressed by the late Judge Garl Watkins in Seattle Crescent, supra, a decision that was called for review by the Commission where it is still pending. Judge Watkins held for the employer in that case.[5/] In connection with its argument, Respondent has also filed a motion "FOR SUPPLEMENTATION OF THE RECORD" for the purpose of introducing in evidence a copy of a letter dated July 11, 1977 from an official of the Occupational Safety and Health Administration to a private organization which purports to espouse that Administration's view that this same standard historically has been deemed applicable only to cargo stowed in holds of ships, rather than on their decks.

Complainant has not responded in any way to the argument of Respondent nor to its motion (29 C.F.R. 2200.37). While Complainant's inaction tends to reflect a lack of interest in expressing a view on the legal question raised, I do not consider that it confers authority in me to grant Respondent's motion without reopening the record, and indeed reconvening the hearing to allow Complainant the opportunity to object of rebut the proffered evidence (see Secretary of Labor v. Occupational Safety and Health Review Commission et al, 492 F.2d 1027 (2d Cir., 1974)), a course of action that would only delay a prompt disposition of the case, one that I choose not to follow. Rather, I find that the legal question is readily resoluble on the present record without the evidence tendered by Respondent. Accordingly, Respondent's motion is denied and the proffered evidence will not be considered.

5/ I do not rely on Judge Watkins decision in that case, as it was motivated by considerations not present herein.

29 C.F.R. 1918.32 is entitled "Stowed cargo and temporary landing platforms", and subpart (b) has already been set forth verbatim earlier in this decision. Although subpart (a) of the standard appears to furnish no insight into the legal question involved, subpart (c) thereof reads as follows:

> "When two gangs are working in the same hatch on different levels, a safety net shall be rigged and securely fastened so as to prevent men or cargo from falling."

A reading of subparts (b) and (c) together tends to raise the inference that the entire standard was intended to apply only to cargo stowed in the holds of ships. However, the inquiry need not end there.

An important rule of statutory construction is that the meaning of words may be determined by other words with which they are associated in order to avoid the giving of unintended breadth to acts of Congress (Third National Bank in Nashville v. Impac, Ltd., Inc. et al, 97 S. Ct. 2307,___U.S.___, (1977); John T. Jarecki et al, v. G.D. Searle & Co. et al, 81 S. Ct. 1579, 367 U.S. 303 (1961)). While of course a standard promulgated by Complainant, which is not inconsistent with the enabling statute, is not an act of Congress, it has the force of law and is subject to the same construction and interpretation as those applicable to statutes (Rucker v. Wabash Railroad Co., 417 F.2d 146 (7th Cir., 1969)).

29 C.F.R. 1918.33 is entitled "Deck loads" and reads as follows:

> "(a) Employees shall not be permitted to pass fore and aft over or around deck loads unless there is a safe passage.
>
> "(b) Signalmen shall not be permitted to walk over deck loads from rail to coaming unless there is a safe passage. If it is necessary to stand at the outboard or inboard edge of the deckload where less that 24 inches of bulwark, rail, coaming, or other protection exists, any signalman shall be provided with a suitable means of protection against falling from the deck load."

As is apparent, this standard deals specifically with hazards incidental to employees mounting cargo stowed on decks of ships. Unfortunately, its wording is such that it does not encompass the factual situation involved in this case. Stated otherwise, the employees in this case were not using the roofs of the modular homes as passageways,[6/] nor were they working on the roofs in the capacity of signalmen.

In viewing these two standards together, I conclude that the former relates only to cargo stowed below decks. As the latter standard is the one intended to cover deck stowed cargo and it falls short of proscribing a hazard related to the situation observed by Ellis, item 1 of the citation must be vacated.

V

The apparent disagreement between the parties on the hard hat charge, as far as its merits are concerned, is whether it was willful, as I find no serious challenge by Respondent to the fact that the violation existed at the time of the inspection. In fact, Respondent's witness Amato conceded the fact.

Before discussing this charge, however, I am constrained to note my disturbance over some aspects of the evidence which may have played some part in the decisional process in connection with the preference of both charges. In particular, I refer to the area director's comments about future hard hat charges at Respondent's prior safety meetings, the policy that a maximum penalty was recommended on all willful charges emanating from this particular office, including those in this case, and Hodski's allegations concerning Ellis' conduct the day before and the day of the inspection. As to these allegations against Ellis, I find no reason to resolve the conflict between Hodski, and Ellis who denied them. I do, however, conclude, without assessing blame, that the inspection was fraught with dissension and thus not conducted in an atmosphere conducive of rational judgments by the participants.

6/ I am not even convinced that 29 C.F.R. 1918.33(a) is in any way related to fall protection equipment.

In any event, Bogdon, according to Ellis, played an important role in Ellis' recommendation that both charges be alleged as willful, because Bogdon admitted to Ellis his role in the hard hat violation, and declined to accede to the latter's demand that the work on the roofs be stopped forthwith.

Although Bogdon was described as a foreman, the evidence is clear that he was not a foreman in the ordinary sense of the word. Rather, he was only recently employed by Respondent on a trial basis for the position of foreman,[7/] and in fact, was later fired for incompetence and irrational conduct at the end of his probationary period. Moreover on the day of the inspection, Amato, his immediate superior, assigned him what Amato inferred was a simple task on the pier, as he was too "new" and could not be "trusted" with more formidable tasks normally assigned to one in that position. Bogdon was therefore a trainee-foreman in every sense of the word.

As Bogdon actually created the hard hat violation by ordering the employees to start work without them and then not supplying them as promised, two questions must be resolved - first, whether Respondent was chargeable with that violation, and second, if the answer to the first is in the affirmative, whether the evidence supports the willful allegation of that charge.

An employer is generally responsible for violations created by or within the actual or constructive knowledge of its supervisory personnel in charge of the particular worksite (see Secretary v. Interstate Roofing Co., Inc., 78 OSAHRC 52/A2). Thus, in Secretary v. Ocean Electric Corporation, 75 OSAHRC 6/C14, the majority, in imputing the act of a foreman to the employer, noted that the foreman "was Ocean Electric's highest ranking employee on the site." Also, when Ocean Electric was before the Fourth Circuit, that Court noted that "Ocean cannot disavow the acts of its

7/ It is of interest to note that Respondent apparently is limited to hiring foremen from the union ranks.

foreman, Watson, for at the time of the accident he was the Company's representative at the jobsite" (Ocean Electric Corp., v. Secretary of Labor et al, No. 76-1060, August 2, 1977). Willfulness, too, is ordinarily imputed from the senior representative at the worksite to the employer:

> ". . . under the circumstances and in view of [the foreman's] authority over the worksite, [the foreman's] willful conduct may be imputed to Respondent" (Secretary v. C.N. Flagg and Co., 74 OSAHRC 66/A2). (Emphasis added) 8/

In light of these precedents, I answer the first question in the affirmative. However, Respondent must bear responsibility for the hard hat violation not through Bogdon but through Amato, the superintendent who was on board the ship all through the day, except for short absences, filling in for an absent foreman (Tr.273). Not only is it clear from the evidence that the very nature of his work on deck clearly permitted him to oversee the activities on the pier, but his testimony shows that from his position on deck, he saw Ellis on the pier shortly after he arrived (Tr. 275-277), that he encountered Ellis on the pier thereafter when Ellis pointed out the hatless employees, a situation he immediately corrected (Tr. 277), and that he later observed the encounter between Ellis and Hodski on the pier after he returned to the deck of the ship (Tr. 278). Thus, Amato was in charge of the worksite, not Bogdon.

As the employees worked without hard hats all morning, Amato, through the exercise of reasonable diligence, could have detected the violation and corrected it long before Ellis arrived for the inspection (Secretary v. Minnotte Contracting and Erection Co., 78 OSAHRC 15/D4). Hence, Amato's constructive knowledge of the existence of the hard hat violation must be imputed to Respondent.

The second question, however, must be answered in the negative, as there is no evidence remotely suggesting that Amato had previously detected the violation and had willfully failed to correct it before Ellis appeared to inspect. As Amato was present on the scene and was

8/ See also Secretary v. Western Waterproofing Co., Inc., 77 OSAHRC 25/A2, where the foreman whose willful act was imputed to the employer was the employer's senior representative at the worksite.

was Respondent's agent in charge of the worksite, Bogdon's willful act, if such it was, is not imputable to Respondent (Secretary v. C.N. Flagg and Co., supra and Western Waterproofing Co., Inc., supra).

Finally, I have carefully considered all of the evidence of record in connection with Respondent's safety program dealing with the wearing of hard hats and its measures to implement it, and find nothing in the nature of a defense that would relieve Respondent of responsibility for that violation (see Secretary v. Western Waterproofing Co., Inc., supra).

VI

As the willful allegation of the hard hat charge is not sustained, and the citation did not characterize the violation as serious, a determination must be made as to what type of charge can and should be affirmed. I conclude that the hard hat violation must be affirmed as other than serious.

A willful charge that does not characterize the violation as serious may nevertheless be affirmed as a serious charge where the record shows that the serious nature of the violation was tried by the express or implied consent of the parties. (Secretary v. Toler Excavating Co., 75 OSAHRC 76/C8; Secretary v. Environmental Utilities Corp., 77 OSAHRC 40/A2). The elements of a serious charge are that the hazard presents a substantial probability that death or serious bodily harm could result therefrom, and that the employer knew, or through the exercise of reasonable diligence, could have known of the existence of the hazard (id.).

Although Ellis testified that the hatless employees could receive head injuries in the course of their work with the modular homes on the pier, he never expressed any opinion that such injuries could be serious or result in death. Moreover, the remaining evidence of record pertaining to this charge does not otherwise support such a finding. Hence, I am precluded from affirming the hat charge in any degree higher than an other than serious violation.

VII

In fulfilling my responsibility under 29 U.S.C. 666(j) to assess penalties that are appropriate under the facts of the case, I find that the gravity of the hard hat violation was relatively low and that a penalty of $50 is appropriate.

VIII

After reviewing the entire record and considering the briefs and arguments of the parties, I reach the findings and conclusions that follow.

FINDINGS OF FACT

1. That at the time and place alleged, Respondent entered the worksite with the permission of the owner of the property;

2. That Ellis observed the conditions that he thought constituted violations from a place where he had obtained the owner's permission to be and prior to the time he encountered any of Respondent's employees;

3. That there was no evidence that Respondent was prejudiced in any way by any failure on the part of Ellis to comply with the inspection requirements of 29 U.S.C. 657;

4. That Respondent was verbally informed of the substance of the complaint that served as the basis for the inspection and there was no evidence that Respondent was prejudiced in any way by Ellis' failure to comply with 29 U.S.C. 657(f)(1);

5. That Bogdon permitted the three employees on the pier to commence work that day without wearing hard hats and had allowed these employees to continue to so work until Ellis called the matter to Amato's attention during the course of the inspection at some time after 1:00 p.m.

6. That Bogdon was a trainee-foreman who was later discharged for both incompetence and incapacity, and that he was not in charge of the worksite which included the activities on the pier as well as on board the ship;

7. That the employees were furnished hard hats and required to use them within a reasonable time after the matter was called to Amato's attention;

8. That although Amato, through the exercise of reasonable diligence, could have detected the hard hat violation earlier that day, there was no evidence that he had done so and failed to take corrective action;

9. That although the evidence raises a reasonable inference that the employees who were not wearing hard hats could have sustained a head injury by reason thereof, there was no evidence that such injury might have been serious or have resulted in death; and

10. That the modular homes involved in the first charge were stowed on the deck, rather than in a hold of the ship

## CONCLUSIONS OF LAW

1. That this Commission has jurisdiction over the proceedings;

2. That the inspection in this case was not conducted in violation of the Fourth Amendment or any of the provisions of 29 U.S.C. 657;

3. That 29 C.F.R. 1918.32(b) pertains solely to cargo stowed in the hold of a ship and that 29 C.F.R. 1918.33, the standard applying to deck stowed cargo, does not contain any provision which could serve as a basis for the allegations contained in item 1;

4. That Respondent did not violate 29 U.S.C. 654(a)(2) by not complying with 29 U.S.C. 1918.32(b);

5. That Respondent was in violation of 29 U.S.C. 654(a)(2) by not complying with 29 C.F.R. 1918.105(a), but such violation was other than serious rather than willful; and

6. That a penalty of $50 is appropriate for item 2.

IX

Item 1 of Citation number 1 for willful violations is vacated, whereas item 2 of said Citation, modified to alleged an other than serious violation, is affirmed. A penalty of $50 is assessed for item 2.

So ORDERED.

| SECRETARY OF LABOR,<br>Complainant,<br>v.<br>DAVIS METAL STAMPING, INC.,<br>Respondent. | OSHRC Docket No. 78-5775 |

DECISION

Before ROWLAND, Chairman; CLEARY and COTTINE, Commissioners.

BY THE COMMISSION:

A decision of Administrative Law Judge Louis G. LaVecchia is before the Commission for review pursuant to section 12(j), 29 U.S.C. § 661(i), of the Occupational Safety and Health Act of 1970, 29 U.S.C. §§ 651-678 ("the Act"). In his decision, Judge LaVecchia granted a motion by Respondent, Davis Metal Stamping, Inc., to dismiss the complaint filed in this case and also the citations issued against it by the Secretary of Labor ("the Secretary"). The judge concluded that the inspection warrant purportedly authorizing the inspection by the Secretary that led to the issuance of these citations was invalid because that warrant was sought and obtained ex parte. Specifically, the judge determined that the first regulation to be published at 29 C.F.R. § 1903.4 1/ did not

1/ The regulation at issue, the original 29 C.F.R. § 1903.4, provided in pertinent part as follows:

> Upon a refusal to permit a Compliance Safety and Health Officer, in the exercise of his official duties, to enter without delay and at reasonable times any place of employment . . . he shall immediately report the refusal and the reason therefor to the Area Director. The Area Director shall immediately consult with the Assistant Regional Director and the Regional Solicitor, who shall promptly take appropriate action, including compulsory process, if necessary.

(Footnote cont'd)

empower the Secretary to obtain ex parte warrants. The Secretary petitioned for review of the judge's decision and Commissioner Cottine directed review of all of the issues raised by the Secretary's petition. For the reasons stated herein, the Commission reverses the judge's decision.

I

Respondent operates a metal-stamping facility in Dallas, Texas. Occupational Safety and Health Administration ("OSHA") compliance officer Ronald Sarnacki attempted to inspect this workplace on September 18, 1978. Upon Sarnacki's arrival, Respondent's president and vice-president met with Sarnacki, who explained the purpose of his visit. Respondent's vice-president told the compliance officer that the mechanical power presses in the plant were unguarded. He added that Respondent could not afford to stay in business if it were required to guard the machines. Respondent's officers then refused to permit an inspection.

In an ex parte proceeding on September 27, 1978, Sarnacki applied to a United States magistrate for a warrant to inspect Respondent's facility. The magistrate reviewed a supporting affidavit that noted (a) the scheduling of the initial inspection "on a high hazard industry basis," (b) Respondent's refusal to permit an inspection, and (c) the stated reasons for the refusal. He found probable cause for an inspection and issued an inspection warrant.

On the next day, September 28, the compliance officer returned to the worksite, presented the warrant, and inspected Respondent's facility. As a result of the inspection, the Secretary issued to Respondent citations for willful, serious, and other-than-serious violations of the Act that alleged noncompliance with machine guarding and electrical standards and recordkeeping regulations.

---

(Footnote 1 cont'd)

Since the inspection in this case, the regulation has been amended twice, as described subsequently in this decision. Nevertheless, it is the regulation as stated above that is at issue in this proceeding because it was that regulation which was in effect at the time the warrant was obtained.

The proposed penalty amounted to more than $6,000. Respondent timely contested the citations.

On May 2, 1979, Respondent filed a pre-hearing motion to dismiss on the ground that the inspection that led to the citations was based on an illegal inspection warrant. Specifically, it asserted that the warrant was illegal for two reasons: (1) OSHA violated its own regulations in obtaining the warrant ex parte, and (2) the warrant was not supported by a showing of probable cause. On May 14, 1979, Administrative Law Judge Henry F. Martin, Jr., denied Respondent's prehearing motion to dismiss the complaint and citation, but he did so without prejudice to the Respondent's right to present evidence in support of its contentions. Subsequently, the judge held a two-day hearing that was limited solely to Respondent's warrant challenges.

In an August 27, 1979 order, the judge again denied Respondent's motion to dismiss. He concluded, on the basis of the evidentiary record, that the Secretary's inspection warrant was based on probable cause. In addition, the judge rejected Respondent's second challenge to the warrant, i.e., that the inspection warrant was illegal because it was obtained ex parte and the Secretary failed to notify Respondent of the date that the warrant would be executed. The judge expressly disagreed with Respondent's argument that the Secretary was not authorized to obtain ex parte warrants. On Respondent's motion, the judge certified his August 27 order for interlocutory appeal. The Commission subsequently dismissed the appeal as improvidently granted and remanded the case.

Following reassignment of the case, Administrative Law Judge Louis G. LaVecchia held a three-day hearing on the merits of the alleged violations. On May 8, 1980, while the case was pending before the judge for a decision on the merits, Respondent filed a renewed motion for dismissal based on the ground that the warrant was obtained ex parte. Respondent did not revive the probable cause challenges that had been decided by Judge Martin in his August 27, 1979 order. Judge LaVecchia took the renewed motion under advisement. He later granted Respondent's motion in his decision now on review.

In granting Respondent's motion to dismiss, the judge held that the original regulation at 29 C.F.R. § 1903.4 did not empower the Secretary to seek warrants ex parte. He relied on the reasoning of the United States Court of Appeals for the Third Circuit in Cerro Metal Products, Division of Marmon Group, Inc. v. Marshall, 620 F.2d 964 (3d Cir. 1980), aff'g 467 F. Supp. 869 (E.D. Pa. 1979) ("Cerro"). Consequently, the judge dismissed the complaint and vacated the citations because, in his view, they were based on an illegal inspection. He did not reach the merits of the alleged violations.

II

The Secretary initially asserts on review that the Commission is not empowered to review warrant challenges. The Secretary argues that, by reviewing the validity of a warrant, the Commission in effect violates the constitutional separation of powers doctrine by reviewing a judicial decision on warrant issuance. The Secretary specifically rejects the contrary reasoning in Sarasota Concrete Co., 81 OSAHRC 48/A2, 9 BNA OSHC 1608, 1981 CCH OSHD ¶ 25,360 (No. 78-5264, 1981), appeal filed, No. 81-5621 (5th Cir. June 23, 1981) ("Sarasota Concrete"), and in Babcock & Wilcox Co. v. Marshall, 610 F.2d 1128 (3d Cir. 1979) ("Babcock & Wilcox"). According to the Secretary, this case presents his first opportunity to address this issue before the Commission because the issue was beyond the scope of the direction for review in Sarasota Concrete. The Secretary specifically urges that, by reviewing the search warrant issue in the instant case, the Commission improperly reviews the magistrate's implicit finding that the Secretary is empowered to seek warrants ex parte.

We reject the Secretary's contentions. In Marshall v. Barlow's, Inc., 436 U.S. 307 (1978) ("Barlow's"), the United States Supreme Court held that the Act violates the fourth amendment to the extent that it purports to authorize warrantless, nonconsensual searches. Before the Court's May 23, 1978 Barlow's holding, the Commission refrained from reviewing fourth amendment challenges to warrants because it lacked authority to rule on the constitutionality of section 8(a) of

the Act, 29 U.S.C. § 657(a). With the Barlow's decision, however, the Court removed any impediment to Commission determination of warrant challenges. Consequently, in Chromalloy American Corp., 79 OSAHRC 55/D11, 7 BNA OSHC 1547, 1979 CCH OSHD ¶ 23,707 (No. 77-2788, 1979) ("Chromalloy"), the Commission asserted its authority to address inspection warrant challenges. Subsequently, the United States Courts of Appeals for the First, Third, Fifth, Eighth, and Ninth Circuits held that, in challenging executed warrants, employers must first exhaust their administrative remedies before the Commission. 2/ These courts determined that Commission review in the first instance does not violate employer rights because Commission decisions are subject to review in the courts of appeals. Furthermore, this approach avoids duplicative judicial proceedings by making unnecessary the development of a factual record in a district court review of the warrant determination that is separate from the Commission's proceedings.

Several of these courts also have rejected the argument that Commission review violates the separation of powers doctrine. For example, in Babcock & Wilcox, the Court of Appeals for the Third Circuit rejected the employer's contention that the Commission, an executive branch agency, is not authorized to review the validity of warrants issued by magistrates of the judicial branch. According to the court, the Commission does not "sit in direct review of the decision of the magistrate." 610 F.2d at 1136. Instead, the Commission decides "whether to use the evidence obtained from the inspection." Id. The Commission subsequently adopted the Babcock & Wilcox view in its decision in Sarasota Concrete, when it reaffirmed its holding in Chromalloy that it has the authority to review warrant challenges. Having considered the Secretary's arguments in this case, we adhere to our position as stated in Chromalloy and in Sarasota Concrete.

---

2/ In re Quality Products, Inc., 592 F.2d 611 (1st Cir. 1979); Babcock & Wilcox Co. v. Marshall, supra; Marshall v. Whittaker Corp., Berwick Forge & Fabricating Co., 610 F.2d 1141 (3d Cir. 1979); Baldwin Metals Co. v. Donovan, 642 F.2d 768 (5th Cir. 1981); Marshall v. Central Mine Equipment Co., 608 F.2d 719 (8th Cir. 1979); In re J.R. Simplot Co., 640 F.2d 1134 (9th Cir. 1981).

In any event, we observe that the Commission is clearly competent to consider the interpretative question that is presented in this case, i.e., whether the Secretary exceeded his authority under section 1903.4. The Commission has jurisdiction to determine whether the Secretary exceeds his statutory or regulatory authority. See Willamette Iron & Steel Co., 81 OSAHRC 59/A2, 9 BNA OSHC 1900, 1981 CCH OSHD ¶ 25,427 (No. 76-1201, 1981); Newport News Shipbuilding & Drydock Co., 80 OSAHRC 119/A2, 9 BNA OSHC 1085, 1980 CCH OSHD ¶ 25,003 (No. 76-171, 1980). Indeed, the Commission has frequently determined whether the Secretary violated his own regulations. E.g., Accu-Namics, Inc., 74 OSAHRC 35/A2, 1 BNA OSHC 1751, 1973-74 CCH OSHD ¶ 17,936 (No. 477, 1974), aff'd, 515 F.2d 828 (5th Cir. 1975), cert. denied, 425 U.S. 903 (1976). Accordingly, the Secretary's argument that the Commission is impermissibly reviewing the magistrate's determinations is rejected here.

III

The Secretary further maintains that, even if the Commission is empowered to review warrant challenges, the issue in this case is prematurely before the Commission because the judge erred by failing to first decide the case on its merits before reaching the warrant validity question. According to the Secretary, an initial decision on the merits expedites Commission proceedings by avoiding delay and "needless review and remand." The Secretary relies on the principle, frequently stated by the Commission, that judges usually should defer ruling on a motion to dismiss until the evidentiary record is complete. E.g., Harrington Construction Corp., 77 OSAHRC 7/B3, 4 BNA OSHC 1471, 1976-77 CCH OSHD ¶ 20,913 (No. 9809, 1976).

We reject the Secretary's suggestion that judges are required to decide the merits of a case before resolving warrant validity questions. We do not agree with the Secretary's assertion that it is efficient to first fully decide the merits of alleged violations and then consider whether the inspection warrant was invalid. The judge here heard all of the evidence on the merits before deciding

the warrant issue, thereby preserving the record in the event of reversal on review. We therefore conclude that he acted properly by ruling on Respondent's dismissal motion without first ruling on the merits. 3/

IV

The Secretary's principal contention is that the judge erred in holding that the original section 1903.4 did not authorize the Secretary to obtain ex parte inspection warrants and that the Secretary therefore acted improperly in securing the warrant without notifying Respondent. We agree that the judge erred. Both the language and history of section 1903.4 and the policy considerations underlying the Act support the Secretary's position.

A.

The purpose of the Act is "to assure so far as possible every working man and woman in the Nation safe and healthful working conditions." Section 2(b) of the Act, 29 U.S.C. § 651(b). To achieve this purpose, Congress authorized the Secretary "to enter without delay and at reasonable times" any workplace and "to inspect and investigate during regular working hours and at other reasonable times." Section 8(a) of the Act, 29 U.S.C. § 657(a). In addition, in section 8(g)(2) of the Act, 29 U.S.C. § 657(g)(2), Congress directed the Secretary to prescribe rules and regulations he deems necessary to carry out his responsibilities under the Act, including rules and regulations "dealing with the inspection of an employer's establishment."

Within one week of the Act's effective date, in Part 1903 of his regulations (29 C.F.R. Part 1903), the Secretary set forth policies for inspections and investigations. After comment, the Secretary adopted these regulations, including the original section 1903.4, the provision in effect when the Secretary obtained the ex parte warrant here. 29 C.F.R. § 1903.4 provided in pertinent part that,

---

3/ The Secretary also advances the "familiar principle" that constitutional questions should not be decided if a case can be resolved on other grounds. However, this case presents an issue of regulatory interpretation rather than a constitutional question.

if an employer refused to permit an inspection, the Secretary's agents were to "promptly take appropriate action, including compulsory process, if necessary" to secure entry. The key term "compulsory process" was not defined.

Nevertheless, the Secretary interpreted section 1903.4 in his operations manuals, which are compilations of internal guidelines directed to the Secretary's compliance personnel. In 1972, the first Compliance Operations Manual (COM), published only a few months after the adoption of section 1903.4, included a section on inspection warrants and employer refusals to permit inspections. Paragraph [f] of that section required compliance officers to obtain warrants before attempting an inspection if the officer expected employer refusal. Paragraph [i] prohibited, except in "unusual circumstances" approved by Regional Solicitors, advance warning to an employer "of the fact either that a warrant has been secured or that inspection will take place pursuant to the warrant." These provisions accordingly not only indicated the Secretary's view that he was authorized to obtain ex parte warrants but also stated a clear preference for the use of ex parte warrants. The 1974 Field Operations Manual (FOM) retained these provisions.

In the 1976 FOM, however, the Secretary deleted paragraph [f] on pre-refusal warrants. The Secretary retained the advance warning prohibition, but it was renumbered paragraph [8] and reworded. Thus, the Secretary dropped the word "warrant" and substituted the term "compulsory process." Accordingly, paragraph [8] provided that, with the exception previously noted, "there shall be no advance notice to the employer concerning compulsory process or pending inspection." The Secretary thereby retained his stated preference for the use of ex parte warrants in cases where entry is initially refused.

This 1976 revision of the FOM was consistent with the Secretary's pre-Barlow's legal position that he was authorized under section 8 of the Act to inspect workplaces without resort to compulsory process, particularly inspection warrants requiring a showing of probable cause. To preserve this position, in 1976 the

Secretary began seeking orders compelling entry in adversary proceedings rather than seeking warrants ex parte. This policy apparently was adopted in an effort to avoid the probable cause showing needed in the ex parte warrant proceeding; the Secretary customarily relied solely on his section 8(a) authority as support for orders compelling entry. However, practice was inconsistent in the regions. Some of the Secretary's agents continued to obtain warrants ex parte even though Regional Solicitors frequently approved adversary proceedings as a departure from the FOM's advance notice prohibition under the "unusual circumstances" proviso in FOM paragraph [8].

In presenting the Secretary's case in Barlow's, the submissions of the Solicitor General were ambiguous on whether the term "compulsory process" in section 1903.4 included ex parte warrants. Indeed, the Solicitor General seemed to urge the extreme position that, if the Secretary could not inspect workplaces without a warrant, employers were entitled to an adversary proceeding before issuance of a warrant. See Cerro, 620 F.2d at 976-78. Nonetheless, both the Secretary's jurisdictional statement and his brief in Barlow's indicated his view that obtaining ex parte warrants before an inspection was an option open to him. In addition, during the argument, the Solicitor General noted that search warrants are customarily issued ex parte.

In rejecting the Secretary's position in Barlow's, the Court referred to section 1903.4. According to the Court, the efficacy of the Act is not endangered by a time lapse while an inspector obtains compulsory process after an employer refuses an initial inspection request. The Court specifically noted that "the kind of process . . . apparently anticipated by the regulation [1903.4] provides notice to the business operator." 436 U.S. at 318. Further, the Court said that, "if this safeguard endangers efficient administration of OSHA, the Secretary should never have adopted it, particularly when the Act does not require it." 436 U.S. at 319. If "procedures were available" for the Secretary to seek ex parte warrants and to reappear without further notice, the Court continued, then

the advantage of surprise would not be lost if the employer refused entry. Despite its recognition that the Secretary could provide for ex parte warrant authority, the Court suggested in dictum that the Secretary was not empowered to seek warrants ex parte under the original section 1903.4:

> Insofar as the Secretary's statutory authority is concerned, a regulation expressly providing that the Secretary could proceed ex parte to seek a warrant or its equivalent would appear to be as much within the Secretary's power as the regulation currently in force and calling for "compulsory process."

436 U.S. at 320 n.15.

In November 1978, just six months after the Barlow's decision, the federal district court decision in the Cerro case was issued. The court entered an injunction prohibiting the Secretary from obtaining warrants ex parte. In concluding that the Secretary was not authorized to obtain ex parte warrants, the court relied upon the dictum in Barlow's that section 1903.4 "apparently anticipated" that the Secretary would notify employers before obtaining process.

In December 1978, three months after the inspection in the case now before us, acting partly in response to the Cerro decision, the Secretary amended section 1903.4 by adding a definition of the term "compulsory process" to mean "the institution of any appropriate action, including ex parte application for an inspection warrant or its equivalent." 43 Fed. Reg. 59,838, 59,839 (Dec. 22, 1978)(29 C.F.R. § 1903.4(d)(1979)). In explaining this change, the Secretary indicated that he had always intended "compulsory process" to include ex parte warrants and that his agents routinely had sought and received warrants ex parte before Barlow's. 43 Fed. Reg. 59,839. In addition, the Secretary stated that he considered notice and comment rulemaking unnecessary for this "interpretative rule." Id.

After this amendment had been promulgated, the appellate court decision in the Cerro case was issued. The Court of Appeals for the Third Circuit affirmed the district court's holding that the Secretary was not empowered to seek ex

parte warrants under the original regulation. Rather than defer to the Secretary's interpretation of section 1903.4, the court followed the Barlow's dictum on the regulation as a matter of "sound judicial policy." The court found that, although the Barlow's discussion of section 1903.4 was technically dictum, that dictum was "integral" to the Supreme Court's constitutional holding. The court reasoned in effect that the Secretary had deliberately adopted a litigation strategy in Barlow's of interpreting section 1903.4 to require an adversary proceeding before compulsory process is obtained and further that the Supreme Court had accepted this interpretation as a basis for its decision. Furthermore, the court rejected the Secretary's "opportunistic" interpretation of section 1903.4 in the proceeding before it. The court noted changes that it viewed as inconsistencies in the COM and FOM over the years, and concluded that the interpretation of section 1903.4 as authorizing ex parte warrants was neither "consistent" nor "longstanding." It also determined that the interpretation of the original section 1903.4 in the preamble to the 1978 amendment to the 1971 regulation was not "contemporaneous." For these reasons, the Cerro court refused to defer to the Secretary's interpretation of the regulation. 4/

Similarly, in Marshall v. Huffhines Steel Co., 488 F. Supp. 995 (N.D Tex. 1979), aff'd, 645 F.2d 288 (5th Cir. 1980)("Huffhines"), the lower court held that the Secretary had no authority to seek warrants ex parte based on Barlow's. Unlike the Cerro court, the Huffhines court concluded that the Barlow's dictum on section 1903.4 was not necessarily integral to the constitutional holding. However, it noted the Supreme Court's view that advance notice would not frustrate the purposes of the Act. The Court of Appeals for the Fifth Circuit affirmed without opinion the district court decision in Huffhines.

---

4/ As a result of this adverse decision, the Secretary amended § 1903.4 a second time in 1980, in this instance following notice and comment rulemaking. In his notice of proposed rulemaking, the Secretary reiterated his view that § 1903.4 had always been intended to authorize ex parte warrants. 45 Fed. Reg. 33,652-33,656 (May 20, 1980).

B.

Respondent on review argues, based on Cerro and Huffhines, that the Secretary lacked the authority to obtain inspection warrants ex parte under the original section 1903.4. The Secretary responds that the original section 1903.4 authorized him to obtain ex parte warrants. We agree with the Secretary.

We conclude that the Secretary was authorized by the language of section 1903.4 to obtain ex parte warrants. We further conclude that the Secretary's interpretation is more consistent with the statute and regulations promulgated under it than is the Cerro-Huffhines approach and also that it better effectuates congressional intent. In addition, a number of Courts of Appeals have considered this issue and a majority agrees with this interpretation. Marshall v. Seaward International, Inc., 510 F. Supp. 314 (W.D. Va. 1980), aff'd without published opinion, 644 F.2d 880 (4th Cir. 1981)("Seaward International" ); Rockford Drop Forge Co. v. Donovan, 672 F.2d 626 (7th Cir. 1982)("Rockford Drop Forge"); Stoddard Lumber Co. v. Marshall, 627 F.2d 984, 989 (9th Cir. 1980)("Stoddard Lumber"); Marshall v. W & W Steel Co., 604 F.2d 1322, 1325-26 (10th Cir. 1979) ("W & W Steel").

The alleged inconsistency in the Secretary's interpretation, according to Cerro, is found in the shifts in the Secretary's use of ex parte warrants vis-a-vis orders to compel entry. This analysis, however, overlooks the consistency in the Secretary's practice of using both ex parte warrants and orders to compel entry as enforcement tools. It is undisputed that at all times prior to Barlow's, both before and after the Secretary's 1976 FOM and policy changes, the Secretary relied on section 1903.4 to obtain both types of compulsory process. Only the relative "mix" of the two types of process changed over the years. Indeed, the term compulsory process ". . . is sufficiently broad as to include ex parte application procedure." Seaward International, 510 F.Supp at 317. See Stoddard Lumber, 627 F.2d at 990, citing Cerro (C.J. Seitz, dissenting opinion). The Secretary's practices throughout the history of the Act's enforcement prior to Barlow's

strongly indicate that he interpreted the term "compulsory process" as including both ex parte warrants and orders to compel entry and that he interpreted section 1903.4 as authorizing him to obtain either form of process. The Secretary's interpretation therefore has been both consistent and longstanding. Moreover, that interpretation is virtually contemporaneous. The Secretary's first Compliance Operations Manual was published only a few months after the promulgation of section 1903.4. In his interpretation of section 1903.4 in that manual, the Secretary expressly prohibited his agents from giving advance notice that a warrant was being sought unless the agents obtained authorization from a Regional Solicitor under extraordinary circumstances. This prohibition, supported by sections 2(b)(10), 8(a)(1) and 17(f) of the Act, 29 U.S.C. §§ 651(b)(10), 657(a)(1) and 666(f), 5/ was retained in all pre-Barlow's versions of the Secretary's operations manuals.

The Secretary's position also is consistent with the congressional intent and the statutory framework of the Act. The Act does not require notification to employers before an inspection. To the contrary, under sections 2(b)(10) and 17(f) of the Act, 29 U.S.C. §§ 651(b)(10), and 666(f), the Act provides for an enforcement program that "include[s] a prohibition against giving advance notice of any inspection and sanctions for any individual violating this prohibition." Indeed, ex parte warrants are necessary to preserve the element of surprise that Congress deemed essential to OSHA inspections. E.g., 116 Cong. Rec. 38,709 (1970)

---

5/ Under section 2(b)(10) of the Act, an enforcement program must "include a prohibition against giving advance notice of any inspection and sanctions for any individual violating this prohibition."

Under section 8(a)(1) of the Act, the Secretary is authorized "to enter without delay and at reasonable times any factory, plant, establishment, construction site, or other area, workplace or environment where work is performed by an employee of an employer . . ." [emphasis added]

Finally, under section 17(f) of the Act, "[a]ny person who gives advance notice of any inspection to be conducted under this Act, without authority from the Secretary or his designees, shall, upon conviction, be punished by a fine of not more than $1,000 or by imprisonment for not more than six months, or by both."

(remarks of members of Congress Galifianakis and Steiger). See Rockford Drop Forge, supra. Thus, the Court of Appeals for the Fifth Circuit, for example, has determined that Congress added the language directing the Secretary to enter worksites "without delay" in section 8(a) of the Act "to preserve the element of surprise deemed essential to inspections" that would be lost in an adversary proceeding. Marshall v. Shellcast Corp., 592 F.2d 1369, 1371-72 n.5 (5th Cir. 1979), quoting Marshall v. Gibson's Products, Inc., of Plano, 584 F.2d 668, 672-73 (5th Cir. 1978). Moreover, the Shellcast court concluded that "Congress, desiring an enforcement scheme based on surprise and undelayed searches, would very much prefer immediate execution of duly-issued ex parte warrants to the litigation-ladened delays" resulting from any procedure that provides notice to employers. Marshall v. Shellcast Corp., 592 F.2d at 1372. Similarly, the Court in Barlow's recognized that the Act contemplates surprise searches, particularly noting the statutory provision imposing penalties for giving advance notice of an inspection at section 17(f) of the Act, 29 U.S.C. § 666(f), and the Secretary's regulation prohibiting advance notice of inspections at 29 C.F.R. § 1903.6.

The inevitable effect of an adversary proceeding requirement would be to "undermine the efficient and speedy implementation of the Act" contemplated by Congress, Marshall v. Shellcast Corp., 592 F.2d at 1372, and to require an unwarranted "consumption of enforcement energies" that would "exceed manageable proportions." Barlow's, 436 U.S. at 321. Ex parte warrants help preserve administrative and judicial resources while adversary proceedings delay inspections and may lead to lengthy litigation. 6/ See, e.g., Marshall v. Chromalloy American Corp., 589 F.2d 1335 (7th Cir. 1979) (warning against turning simple warrant requests into full-blown hearings).

---

6/ In addition, several courts have recognized that advance notice to an employer is unnecessary because an employer has several means of protecting its right of privacy without participating in the warrant application proceeding. First, the employer may move before the district court to

In addition, as we noted previously, of those Circuit Courts of Appeals that have considered either the regulation in question or the 1978 amended version of the regulation, a majority has rejected either directly or implicitly the contention that the original section 1903.4 did not authorize the Secretary to obtain inspection warrants ex parte. 7/ Seaward International, supra; Rockford Drop Forge, supra; Stoddard Lumber, supra; W & W Steel, supra. Moreover, in both Stoddard Lumber and Seaward International the courts emphasized the consistency in the Secretary's position, particularly as reflected in the provisions of his internal manuals prohibiting advance notice that a warrant was being obtained, while de-emphasizing the impact of the Barlow's Court's pronouncements on an issue that, in their view, was not before the Court. In Rockford Drop Forge the court expressly stated its agreement with the reasoning of the Stoddard Lumber and Seaward International courts as well as the reasoning of others that have reached the same conclusion.

---

(Footnote 6 cont'd)

quash the warrant before its execution. E.g., Pelton Casteel, Inc. v. Marshall, 588 F.2d 1182 (7th Cir. 1978). Second, an employer may challenge an assertedly invalid warrant in our proceedings. Commission orders are reviewable by the Courts of Appeals under § 11(a) of the Act, 29 U.S.C. § 660(a). In re Quality Products, Inc., 592 F.2d at 615 n.7. Third, the employer may refuse entry to an inspector with a warrant and then challenge the warrant before the district court when the Secretary brings a civil contempt proceeding. Blocksom & Co. v. Marshall, 582 F.2d 1122, 1124 (7th Cir. 1978). See generally Rockford Drop Forge, supra.

7/ Several other considerations also support our conclusion that the original section 1903.4 authorized the Secretary to obtain ex parte inspection warrants. As the Court observed in Barlow's, ex parte inspection warrants are not prohibited by the fourth amendment. 436 U.S. at 320 (warrant may issue "with or without prior notice"). See also Franks v. Delaware, 438 U.S. 154, 169 (1978)(criminal warrants are necessarily ex parte to prevent destruction or removal of evidence); Stoddard Lumber, supra. Similarly, the fifth amendment does not prohibit ex parte inspection warrants as violative of due process. Heller v. United States, 413 U.S. 483 (1973); Matter of Carlson, 580 F.2d 1365, 1373-74 (10th Cir. 1978). Moreover, the Act itself does not preclude the use of ex parte warrants; accordingly, the Barlow's Court and even the appellate court in Cerro recognized that the Secretary may provide for ex parte warrant authority under the statute. In addition, the regulation at issue, by using the broad term "compulsory process," is written in a manner that encompasses the use of such warrants.

For these reasons, we conclude that the Secretary did not exceed his authority by obtaining an ex parte warrant under the original section 1903.4. 8/

V

On review, Respondent argues that the Commission is bound to follow the holding of the Court of Appeals for the Fifth Circuit in Huffhines that the Secretary lacked ex parte warrant authority under the original section 1903.4. Respondent warns that it will appeal an adverse Commission decision in the Fifth Circuit, where "the disposition of the appeal would be a foregone conclusion in light of Huffhines." In Respondent's view, administrative tribunals must follow the law of the circuit where an action occurs. It cites and relies on cases such as Jones & Laughlin Steel Corp. v. Marshall, 636 F.2d 32, 33 (3d Cir. 1980)(the court held that its law binds "all tribunals and litigants," including federal administrative agencies, in its jurisdiction); Allegheny General Hospital v. NLRB, 608 F.2d 965 (3d Cir. 1979); and NLRB v. Gibson Products Co., 494 F.2d 762, 766 (5th Cir. 1974). The Secretary takes the contrary position that the Commission is not bound by the decision in Huffhines.

We reject Respondent's arguments. Commissioner Cleary will follow circuit law in some situations, where, for example, precedent in the circuit is clear to the point that reversal appears certain, and it would be unreasonable to require one of the parties to expend resources and monies to obtain a pro-forma reversal of the Commission. However, Commissioner Cleary finds that the disposition of an appeal in the Court of Appeals for the Fifth Circuit in this case is not a "foregone conclusion" under Huffhines. Huffhines is distinguishable from this case because it concerned a motion to quash an ex parte warrant before its execution. The Huffhines court did not reach the question of how to remedy an invalid inspection. Consequently, the Fifth Circuit may invalidate the Secretary's

---

8/ In light of our conclusion that the Secretary acted within the scope of his authority under the regulation, we need not address the various arguments raised by the parties concerning the appropriate remedy for an illegal inspection.

ex parte warrant on appeal under Huffhines, but the question of whether the court will afford Respondent a remedy such as suppression of the Secretary's evidence is open. In United States v. Williams, 622 F.2d 830 (5th Cir. 1980), several judges hearing a criminal case en banc stated in a separate opinion that evidence is not to be suppressed under the exclusionary rule when discovered by officers in the course of actions that are taken in the good faith, though mistaken, belief that they are authorized. The judges' discussion of the exclusionary rule in that case was technically dicta, as other judges on the panel noted, because the search in question was found to be valid. Here, however, the Fifth Circuit would presumably find that the search was invalid and it would necessarily have to reach the question of whether a remedy would be appropriate. In view of the fact that twelve judges on the twenty-four judge panel in United States v. Williams joined in the endorsement of the good faith exception to the exclusionary rule, Commissioner Cleary cannot assume that the Fifth Circuit will necessarily rule in favor of Respondent on appeal.

Commissioner Cottine rejects Respondent's arguments based on his adherence to the Commission's often-stated position that Congress established the Commission to achieve uniformity in adjudications involving national occupational safety and health law and that, while the Commission gives deference to the views of the circuit courts of appeals, it is not bound to acquiesce in the views of the circuits that conflict with those of the agency. E.g., Raybestos Friction Materials Co., 80 OSAHRC 111/E14, 9 BNA OSHC 1141, 1980 CCH OSHD ¶ 24,910 (No. 80-2793, 1980); Farmer's Export Co., 80 OSAHRC 66/A2, 8 BNA OSHC 1655, 1980 CCH OSHD ¶ 24,569 (No. 78-1708, 1980); S & H Riggers & Erectors, Inc., 79 OSAHRC 23/A2, 7 BNA OSHC 1260, 1979 CCH OSHD ¶ 23,480 (No. 15855, 1979), rev'd on other grounds, 659 F.2d 1273 (5th Cir. 1981). Commissioner Cottine notes that, in view of the split among courts of appeals on the ex parte warrant authority question, the Commission is authorized and, indeed, obligated to independently consider this issue of first impression before the Commission. See Raybestos Friction Materials Co., supra.

For the reasons noted in part IV, we find that the judge erred in concluding that the Secretary's ex parte inspection warrant was invalid. Accordingly, we reverse the judge's decision dismissing the Secretary's complaint and vacating the citations at issue and remand the case for findings and conclusions on the merits of the alleged violations.

SO ORDERED.

FOR THE COMMISSION

Ray H. Darling, Jr.
Ray H. Darling, Jr.
Executive Secretary

DATED: JUN 30 1982

ROWLAND, Chairman, Dissenting in Part:

I join in Parts II and III of the lead opinion in which the majority concludes that the Commission is empowered to rule on the issue presented in this case and that the procedural posture of the case warrants consideration of the issue at this time. I dissent from Parts IV and V in which the majority concludes that the Secretary acted properly in obtaining the inspection warrant against Respondent ex parte.

Notwithstanding footnotes 6 and 7 of the majority opinion and its extensive discussion regarding the "congressional intent and statutory framework of the Act," the issue before us is not whether ex parte warrants are permissible under the Constitution and the Act, nor are we asked in this case to decide the wisdom or desirability of ex parte warrants as an enforcement mechanism. Rather, as the majority itself concedes in Part II, the question presented here is a very narrow one--whether, regardless of the legality and propriety of ex parte warrants as a general proposition, the Secretary's procedure in this case was contrary to his own regulation. I would follow the holdings of the two courts of appeals which held that the Secretary's procedural regulation in effect at the time in question here, 29 C.F.R. § 1903.4, did not authorize the Secretary to obtain inspection warrants ex parte. Cerro Metal Products, Division of Marmon Group, Inc. v. Marshall, 620 F.2d 964 (3d Cir. 1980); Donovan v. Huffhines Steel Co., 645 F.2d 288 (5th Cir. 1980), aff'g Marshall v. Huffhines Steel Co., 488 F. Supp. 995 (N.D. Tex. 1979). I am not persuaded by the contrary holdings of other courts of appeals on which the majority relies because I do not find those opinions well-reasoned.

As the majority opinion indicates, the decisions in Cerro and Huffhines were essentially predicated on the same factors. Both courts emphasized the Secretary's conscious litigation strategy before the Supreme Court in Marshall v. Barlow's, Inc., 436 U.S. 307 (1978), in which the Secretary contended that warrantless inspections were proper because an employer's rights could be protected in an adversary proceeding with notice to the employer in the event the employer failed to consent to a warrantless inspection. The appellate courts noted that the statements of the Supreme Court--albeit in dicta--that the regulation in question did not contemplate an ex parte proceeding were based upon the Secretary's representations before the Court as well as on the fact that the inspection in Barlow's took place pursuant to a court order issued after an adversary hearing. As the majority explains, the court in Cerro further relied on the Secretary's change in his internal operating manuals by which the word "warrant" was deleted from the provision precluding advance notice to employers.

The majority concludes, however, that ex parte proceedings were still contemplated under the Secretary's regulation authorizing "compulsory process." The majority reasons that, notwithstanding the Supreme Court's statements to the contrary, the Secretary in Barlow's preserved a position that ex parte warrants were an available option. As further support for its conclusion, the majority claims that the Secretary's practice of applying for ex parte warrants and his interpretation of his regulation as authorizing such process were both consistent and of long duration. Finally, the majority relies on those courts of appeals which have issued opinions contrary to Cerro and Huffhines. For the reasons that follow, I disagree with the majority's reasoning as well as with the judicial authority on which its decision in this case is based.

Insofar as the significance of the Barlow's decision is concerned, the Secretary in his jurisdictional statement before the Court conceded that in civil practice commonly "a show cause order [i.e., an order giving the employer an opportunity to appear and defend] issues before compulsory process may be obtained." See Huffhines, 488 F. Supp. at 998 n.2. Similarly, at oral argument before the Court, the Secretary acknowledged that compulsory process is an adversary proceeding, as distinguished from an ex parte warrant. 9/ Although the Cerro and Huffhines courts drew slightly different conclusions from the oral argument, 10/ both emphasized that the Secretary was in effect representing to

---

9/ The transcript of the oral argument is quoted extensively in both the Cerro and Huffhines opinions. However, a few brief excerpts will be illustrative:

> MR. McCREE: Now, as a matter of practice, the Regional Inspectors have then gone to the court to obtain an order requiring the proprietor to submit to the inspection.
>
> * * *
>
> And the court in this case issued an order to show cause which permitted the employer to appear and assert any objection he might have.
>
> QUESTION: So that is more than the equivalent of a search warrant . . . .
>
> MR. McCREE: Considerably more, because it is an adversary proceeding and the search warrant, of course, is ex parte.
>
> * * *
>
> [T]here are regulations which forbid giving advance notice of the intent to inspect, and there are even penalties on the employees for disclosing the intention of inspecting. . . . The regulation affords notice once the court is asked to issue such an order. That is the rare case . . . where he [the inspector] has been turned down [denied entry by the employer]. . . .

See Huffhines, 488 F. Supp. at 998 n.2; Cerro, 620 F.2d at 976-77 n.33.

10/ Cerro concluded that the government had characterized the regulation as providing for adversary process; Huffhines found it uncertain whether the Solicitor General was referring to the requirements of the regulation or to the Secretary's practice under it.

the Court that the employer would have notice that the Secretary desired entry for an inspection. It is not the province of this Commission to dispute, as does the majority, the Court's conclusions drawn from these representations. 11/ As the court stated in Huffhines:

> This issue [the Secretary's interpretation of his authority] was, however, resolved in a fashion binding on a district court when the Supreme Court ruled in Barlow's. To paraphrase Mr. Justice White in Barlow's, if the Secretary's practice did not reflect the limits of his authority, he should never have led the Court so to believe.

488 F. Supp. at 999.

Although the majority characterizes the Secretary's practice of obtaining warrants ex parte as "consistent," it nevertheless concedes that the Secretary also sought orders to compel entry and, indeed, that prior to the Barlow's decision the latter had become the Secretary's primary method for obtaining nonconsensual entry for inspection. The Secretary himself so conceded in Cerro, for in his brief in that case he stated:

> The Secretary's practice with respect to providing employers notice that he was seeking compulsory process was not uniform. Process was at first obtained in the form of ex parte warrants,

---

11/ Nor does the Secretary's brief in Barlow's indicate a view that the regulation in question contemplates ex parte warrants. In addressing his concerns regarding the undesirability of affording an employer notice that the Secretary intended to inspect, the Secretary made no mention of ex parte warrants:

> The fact that current agency regulations (29 C.F.R § 1903.4) provide that the Secretary will, as a matter of self-restraint, obtain a court order if the inspector is initially refused entry does not detract from our argument that a warrant requirement would interfere with the administration of the Act. . . . While an employer may, under the Secretary's regulations, claim an alleged right to refuse entry to an inspector and thereby put him to the burden of seeking a court order to enforce his statutory right of entry, a decision by this Court that no warrant is required would presumably reduce an employer's incentive to do so.

Brief for Appellants at 39 n.20.

> . . . but the Secretary subsequently began to seek orders compelling entry with notice when confronted with a refusal.

Brief at 24 n.24, quoted in 620 F.2d at 976 n.32. Similarly, despite the majority's statement that the Secretary's prohibition against advance notice of a warrant application was retained in all pre-Barlow's versions of the Secretary's operations manuals, the 1976 version of the manual merely provides that no advance notice shall be given of "compulsory process." As indicated above and as the Secretary himself conceded in Barlow's, compulsory process unlike a warrant application is normally an adversarial procedure since the court will customarily afford the employer an opportunity to be heard through the issuance of a show cause order. Therefore, the Secretary's prohibition against advance notice of such a proceeding means nothing more than that the Secretary will not duplicate the notice to an employer which as a matter of course would be furnished by the court. Accordingly, this change in language from the previous version of the operations manual supports the view of the Cerro court that the Secretary now intended that employers would have advance notice if the Secretary wished to enter without consent. 12/

Of the decisions of the four circuit courts of appeals on which the majority relies, only two, Marshall v. Seaward International, Inc., 510 F. Supp. 314 (W.D. Va. 1980), aff'd without published opinion, 644 F.2d 880 (4th Cir. 1981) and Stoddard Lumber Co. v. Marshall, 627 F.2d 984 (9th Cir. 1980), present any extended discussion of the issue. 13/ In Stoddard, the court agreed that

---

12/ This conclusion is supported by the fact that the Secretary also deleted that portion of his operations manual authorizing warrant applications in certain situations even before inspectors attempted to enter a workplace.

13/ Marshall v. W & W Steel Co., 604 F.2d 1322 (10th Cir. 1979) involved an ex parte warrant issued after the 1978 amendment to the Secretary's regulation, at which time the Secretary specifically stated that the term "compulsory process" was intended to include ex parte warrants. The court did not express a view regarding the validity of an ex parte warrant issued prior to the amendment.

(Continued)

the Secretary had taken the position before the Supreme Court that a warrant was unnecessary because those who refused to permit inspection upon request were entitled to notice of compulsory process initiated by the Secretary. It noted as well the Secretary's deletion of his previous authorization of pre-refusal warrants 14/ and, finally, conceded that the Secretary "perhaps unwisely" altered his manual to reflect his belief that nonconsensual warrantless inspections were constitutional. The sole basis for the conclusion of this court and the court in Seaward that nevertheless the Secretary retained authority to obtain ex parte warrants was the view that the prohibition against "advance notice" of "compulsory process" necessarily contemplates ex parte warrants. Both Stoddard and Seaward also determined that such a conclusion is not inconsistent with the Supreme Court's opinion in Barlow's for the reason that the Supreme Court's comments regarding notice to employers must be read in the context of the type of process employed by the Secretary in that case.

I do not find this reasoning persuasive. As explained above, the fact that the Secretary amended his operations manual to proscribe advance notice of "compulsory process" does not indicate that he thereby intended an ex parte warrant procedure. By the same token, the fact that the Secretary had in Barlow's obtained an inspection order after the employer had an opportunity

---

13/ (Continued)

Similarly, the court in Rockford Drop Forge Co. v. Donovan, 672 F.2d 626 (7th Cir. 1982), which also involved a warrant issued after the 1978 amendment, simply relied on the amendment without further elaboration.

14/ See note 12, supra.

to appear and defend supports rather than weakens the conclusion that this was the type of process contemplated by the Secretary. Indeed, Stoddard acknowledges that the Barlow's opinion "can be read as assuming that no ex parte warrant procedure was authorized by the regulations." 627 F.2d at 990.

Accordingly, I conclude that the Secretary's use of an ex parte warrant in this case is contrary to the Secretary regulation in effect at the time, 29 C.F.R. § 1903.4. The question then is what remedy should be applied. 15/ Respondent contends that the Commission should affirm the judge's decision to dismiss the Secretary's citations and complaint. The Secretary, asserting that the judge's order is equivalent to the suppression of evidence, argues that because the warrant in this case was issued prior to the federal district court order in Cerro, suppression of evidence here would be an impermissible retroactive application of the exclusionary rule.

As I have stated infra, this case does not present any issue relating to the validity of agency action under either the Constitution or the Act. Therefore, this issue whether evidence may be excluded as the remedy for an illegal inspection need not be addressed in the circumstances of this case. United States v. Caceres, 440 U.S. 741, 754-55 (1979). See Miller v. United States, 357 U.S. 301 (1958). 16/

---

15/ In view of its disposition, the majority does not reach this issue. See note 8 of the lead opinion.

16/ Additionally, insofar as the Secretary's argument based on retroactivity is concerned, the warrant in this case was applied for and issued subsequent to the Barlow's decision in which the Supreme Court stated its view of Secretary's authority under his regulation. Furthermore, I note that the Court has recently articulated a new rule governing retroactivity of remedy in Fourth Amendment cases. United States v. Johnson, 50 U.S.L.W. 4742 (U.S. June 21, 1982) (No. 80-1608)

Concerning the "good faith" exception to the exclusionary rule, the Commission has previously considered the significance of the Fifth Circuit's en banc decision in United States v. Williams, 622 F.2d 830 (5th Cir. 1980). Noting that the court was divided on the application of the "good faith" principle in that

(Continued)

Rather, this case is governed by the well-established rule that an agency is bound by its own regulations and agency action may be invalidated if it fails to comply with agency rules. Service v. Dulles, 354 U.S. 363 (1957); Bray v. United States, 515 F.2d 1383 (Ct. Cl. 1975); Sangamon Valley Television Corp. v. United States, 269 F.2d 221 (D.C. Cir. 1959), cert. denied, 376 U.S. 915 (1946). The question, then, is whether such a remedy should be applied in this case. In a prior decision involving a challenge to the manner in which the Secretary conducted his inspection, the Commission ruled that the employer was entitled to relief for the Secretary's failure to afford the employer's representatives the right to accompany the inspection, as required by the Act and the Secretary's own rules. Western Waterproofing Co., 76 OSAHRC 64/A2, 4 BNA OSHC 1301, 1976-77 CCH OSHD ¶ 20,805 (No. 1087, 1976). The Commission reasoned that such "walkaround accords employers a substantive right which benefits the utility of inspections under the Act by aiding in voluntary abatement of hazardous working conditions and preventing unnecessary contests. The same may be said for the procedure contemplated by the Secretary's regulation at issue here. Providing an employer the opportunity to be heard in opposition to the Secretary's application

---

16/ (Continued)

case, the Commission characterized the court's analysis as "of questionable precedential value." Sarasota Concrete Co., 81 OSAHRC 48/A2, p. 14, n.10, 9 BNA OSHC 1608, 1614 n.10, 1981 CCH OSHD ¶ 25,360 at 31, 533 n.10 (No. 78-5264, 1981), appeal filed, No. 81-5621 (5th Cir. June 23, 1981). In any event, assuming that the exclusionary rule is even relevant in this case, I would find it difficult to characterize the Secretary's conduct in this case to have been in good faith in view of the Secretary's practice prior to Barlow's and his representations to the Supreme Court in that case.

to enter for an inspection similarly could result in more efficient application of the Secretary's enforcement resources as well as prevent or reduce the issuance of baseless citations and consequent litigation. 17/ Indeed, the Secretary himself represented to the Supreme Court that giving the employer notice and opportunity to appear would protect the rights of the employer in the event the employer would not consent to inspection. Accordingly, in the circumstances of this case, I conclude that the judge acted properly in vacating the citations and dismissing the complaint for failure of the Secretary to act in accordance with his regulation. See United States ex rel. Accardi v. Shaughnessy, 347 U.S. 260 (1954); Bridges v. Wixon, 326 U.S. 135 (1945).

---

17/ While it may be true, as the majority contends, that other policy considerations would justify an ex parte warrant procedure, the Commission's inquiry here is limited to the notice procedure intended by the regulation in existence at the time this case arose.

I note that the Commission decision in Western Waterproofing, supra, was reversed on appeal. Marshall v. Western Waterproofing Co., 560 F.2d 947 (8th Cir. 1977). The court followed a prior decision in another circuit, Accu-Namics, Inc. v. OSHRC, 515 F.2d 828 (5th Cir. 1975), which held that an employer would not ordinarily be entitled to relief from denial of the right to accompany the inspector because the employer would be able to defend against any resulting citations through cross-examination of the inspector and presentation of its own evidence. I do not agree with the reasoning of the Fifth and Eighth Circuits on this issue. I think the Commission's decision in Western Waterproofing states the better rule.

| SECRETARY OF LABOR, Complainant, | ( ) | OSHRC |
| v. | ( ) | Docket No. 78-5775 |
| DAVIS METAL STAMPING, INC., Respondent. | ( ) | |

For the Complainant: Max A. Wernick, Esquire

For the Respondent : Ronald L. Gaswirth, Esquire
Jane A. Matheson, Esquire

## DECISION AND ORDER

This matter is before me on a renewed motion by respondent to dismiss the complaint and vacate the citations which are the basis for the hearings heretofore held on preliminary matters and on the merits.

As grounds for the motion the respondent renews its argument that the citations were invalid since they were based on an inspection made pursuant to an *ex parte* inspection warrant.

There is no Commission precedent on the precise question presented, and the Circuit Courts of Appeal which have considered the issue are divided in their opinions.

The Third Circuit, in Cerro Metal Products v. Marshall, 620 F.2d 964, (decided April 24, 1980), CCH OSHD ¶24,411 (1980), held that 29 CFR 1903.4 did not permit and authorize ex parte inspection warrants. The Tenth Circuit, in W and W Steel Company, Inc. v. Marshall, 604 F.2d 1322, (decided August 28, 1979), CCH OSHD ¶23.807 (1979) had held that ex parte warrants issued under that section were valid. The Ninth Circuit, in Stoddard Lumber Co. v. Marshall, 627 F.2d 984 (decided September 18, 1980), CCH OSHD ¶24,790 (1980) has also held that ex parte warrants issued under similar circumstances were valid. The conflict between the circuits has not yet been resolved.

I am persuaded that the reasoning of the court in the Cerro case is correct, i.e., that the ex parte warrant issued in the case at bar on September 27, 1978 (prior to the amndment of 29 CFR 1903.4 by rule-making proceeding) was not valid. I must respectfully disagree with the reasoning of the courts in W and W Steel Company, Inc., (supra) and Stoddard Lumber Co. (supra). Accordingly, I will dismiss the complaint and vacate the citations herein. In view of this disposition I do not reach the merits of the case.

ORDER

The respondent's renewed motion to dismiss the complaint and vacate the citations in this matter, filed on May 8, 1980, is granted. The complaint is dismissed and the citations are vacated.

So ORDERED.

Louis G. LaVecchia
Judge, OSHRC

Dated: May 28, 1981

Dallas, Texas.

APPEARANCES:

William S. Kloepfer, Esquire, Associate Regional Solicitor, U. S. Department of Labor, Cleveland, Ohio, by Bruce C. Heslop, Esquire, for complainant.

Kathleen M. Brinkman, Esquire, Cincinnati Gas & Electric Company, Cincinnati, Ohio, for respondent.

Robert Hauck, Business Manager, International Brotherhood of Electrical Workers, Cincinnati, Ohio, for the authorized employee representative.

## DECISION AND ORDER

Cutler, Judge:

Following an inspection of its workplace, respondent, Cincinnati Gas and Electric Company, (hereinafter CG&E), was issued a willful citation on October 11, 1979, pursuant to section 9(a) of the Occupational Safety and Health Act of 1970 (29 U.S.C. 651, et seq., hereinafter the "Act").

The citation is comprised of four items with a penalty of $8,000 proposed for each. Under Item 1, respondent is charged with violating section 5(a)(1) of the Act, the general duty clause,[1/] as follows:

> "The employer did not furnish employment and a place of employment which were free from recognized hazards that were causing or were likely to cause death or serious physical harm to employees, in that:
>
> There was no safe work practices program to protect employees handling, storing and transferring line distribution capacitors which contained polychlorinated biphenyls (PCB's) in the basement of the material and repair building. The safe work practices program shall include, but not be limited to:
>
> a) Formulating and enforcing written safe operating procedures on the storage, handling and transferring of capacitors containing PCB's. These operating instructions shall include a description of the appropirate (sic) safe personal protective equipment to be worn by employees to prevent dermal, oral, inhalation and ocular exposures.
>
> b) Instructing present and newly hired employees on the chemical and physical properties of PCB's and training them in the health hazards associated with exposure to PCB's. The health hazard training shall include review of the acute and chronic toxic effects that could result from contact with PCB's.
>
> c) Regulating the access of the work areas where employees could come into contact with PCB's and posting warning signs to define such areas.
>
> d) Storing capacitors containing PCB's in tightly closed containers in an area provided with adequate fresh air ventilation and diking and inspecting the area daily for leaks and spills.

---

1/ Under this provision each employer "shall furnish to each of his employees employment and a place of employment which are free from recognized hazards that are causing or are likely to cause death or serious physical harm to his employees."

e) Instructing present and newly hired employees to remove themselves from the work area if their personal protective clothing or devices become contaminated with PCB's and to remove the contaminated articles, disposing of them properly, washing contaminated parts of the body with soap and water for a minimum of 15 minutes. All employees working in regulated PCB areas shall shower on completion of work in the area(s).

f) Establishing PCB emergency spill procedure and training employees in the procedures so that accidental spills and leaks can be safely handled. These procedures shall include provisions to evacuate all non-essential personnel from the area, furnishing the necessary personnel entering the spill area with appropriate personal protective equipment, adequately ventilating the contaminated area to prevent the accumulation of vapors, and collecting and disposing of the spillage."

Item 2 of the citation charges respondent with failure to comply with the provisions of 29 C.F.R. § 1910.132(a)[2/] as follows:

"Protective equipment was not used where it was necessary by reason of hazards encountered in a manner capable of causing injury or impairment of the function of any part of the body:

The employer did not require employees to wear impervious personal protective equipment, i.e., full body covering and gloves and shoe coverings, when personnel were working with capacitors containing polychlorinated biphenyls in the basement of the material and repair building."

---

2/ This section (29 C.F.R. § 1910.132(a)) reads:

"Application. Protective equipment, including personal protective equipment for eyes, face, head, and extremities, protective clothing, respiratory devices, and protective shields and barriers, shall be provided, used, and maintained in a sanitary and reliable condition wherever it is necessary by reason of hazards of processes or environment, chemical hazards, radiological hazards, or mechanical irritants encountered in a manner capable of causing injury or impairment in the function of any part of the body through absorption, inhalation or physical contact."

Under Item 3, two violations are alleged. Item 3a charges a failure to comply with the provisions of 29 C.F.R. § 1910.133(a)(1)[3/] as follows:

"Protective eye and face equipment was not required where there was a reasonable probability of injury that could be prevented by such equipment:

The employer did not require employees to wear eye and face protection when personnel were handling and transferring capacitors containing polychlorinated biphenyls in the basement of the material and repair building."

Item 3b, citing 29 C.F.R. § 1910.151(c)[4/] states:

"Where employees were exposed to injurious corrosive materials, suitable facilities for quick drenching or flushing of the eyes and body were not provided within the work area for immediate emergency use:

The employer did not provide an eye wash and body shower to employees handling and transferring capacitors containing PCB contaminated oil in the basement of the material and repair building."

---

3/ This (29 C.F.R. § 1910.133(a)(1)) states:

"General. (1) Protective eye and face equipment shall be required where there is a reasonable probability of injury that can be prevented by such equipment. In such cases, employers shall make conveniently available a type of protector suitable for the work to be performed, and employees shall use such protectors. No unprotected person shall knowingly be subjected to a hazardous environmental condition. Suitable eye protectors shall be provided where machines or operations present the hazard of flying objects, glare, liquids, injurious radiation, or a combination of these hazards."

4/ This section (29 C.F.R. § 1910.151(c)) reads:

"Where the eyes or body of any person may be exposed to injurious corrosive materials, suitable facilities for quick drenching or flushing of the eyes and body shall be provided within the work area for immediate emergency use."

Under Item 4 of the citation, respondent was charged with failure to comply with the provisions of 29 C.F.R. § 1910.134(a)(2)[5/] requiring certain procedures and practices in connection with use of respirators when such equipment was necessary to protect the health of employees. At the hearing, respondent moved to dismiss this item. The Government conceded that air levels measured on the date of the inspection did not exceed the limits set in 29 C.F.R. § 1910.1000, Table Z(1). The Government's position was that, even though respirators were not required to be worn, when respondent chose to provide them safe procedures must be followed (Tr. 8-10, 88-89).

The gravamen of the violation charged is that respiratory equipment was necessary to protect the health of employees. The Government conceded the air level measurements were within permissible limits. Thus, employees were not exposed to an inhalation hazard and protective equipment was not necessary.[6/]

The motion to dismiss Item 4 by respondent was granted. This also included the reference to inhalation protection set forth in Item 1a (Tr. 90-91).

---

5/ This (29 C.F.R. § 1910.134(a)(2)) states:

> "Respirators shall be provided by the employer when such equipment is necessary to protect the health of the employee. The employer shall provide the respirators which are applicable and suitable for the purpose intended. The employer shall be responsible for the establishment and maintenance of a respiratory protective program which shall include the requirements outlined in paragraph (b) of this section."

6/ Corbin Lavoy dba Empire Boring Co., 76 OSAHRC 57/A2, 4 BNA OSHC 1259, 1974-75 CCH OSHD ¶ 19,056 (No. 792, 1974); Dick Corp., 79 OSAHRC 101/E8, 1976-77 CCH OSHD ¶ 21,296 (No. 16193, 1976). In both cases, the Commission did not address this issue upon review.

Hearings were held in Cincinnati, Ohio, in this case on June 10 and 11, 1980, and July 29, 1980.

Having requested and been given party status, Robert Hauck, Business Manager, Local 1347, International Brotherhood of Electrical Workers, participated in the proceedings.

There is no issue as to jurisdiction in that respondent, in its answer, concedes it is an employer engaged in a business affecting interstate commerce.

I

Following an employee complaint, respondent's work facility at 2004 Dana Avenue, Cincinnati, Ohio, was the subject of an inspection from August 31 through September 17, 1979, by the Secretary. The specific complaint concerned the adequacy of procedures for handling equipment and materials containing polychlorinated biphenyls (PCB).

On the first day of the inspection, Timothy Grabenstein and Steve Messinger, industrial hygienists for the Secretary, inspected the basement of the Material and Repair (M & R) Building located at the Dana Avenue facility. In diked areas of the basement, line capacitors of varying sizes removed from service are stored pending disposal. Some of the capacitors are stored in 55-gallon drums or plastic bags. Others are stored without any type of container or cover. As required by the Environmental Protection Agency (EPA), the steel drums and capacitors are labeled with caution signs indicating that they contain PCB (Ex. C-1; Tr. 22-30).

According to the evidence, the handling operation of capacitors in preparation for disposal is performed one or two times a month, requires three to four hours to complete, and involves three or four employees (Tr. 330-331, 466-467). Employees would remove the capacitors from banks or racks, record the serial

number, place them in containers for disposal. Smaller units would be placed in 55-gallon drums while larger ones were put in four-foot square steel boxes (Ex. C-7; Tr. 22-23, 64-69, 329-332). Approximately 15% of the capacitors leaked oil (Tr. 465).

Sampling to determine the presence of PCB and the levels of employee exposure thereto was performed on August 31 and September 17. Although employees were not engaged in handling capacitors on the earlier date, Mr. Messinger took a wipe sample of oily material on the floor adjacent to a plastic bag containing a leaking capacitor in storage (Ex. C-1, p. 2, bottom photograph; Ex. C-2, sample sheet 3, Wipe #1; Tr. 138-140). Analysis of that sample by the OSHA Laboratory determined that it contained 77 milligrams (mg) of PCB (Ex. C-2, C-6; Tr. 141, 369-371).

On September 17 Mr. Grabenstein performed wipe sampling and air sampling of employees engaged in the capacitor handling operation (Ex. C-3, C-4; Tr. 31-51). Wipe samples to determine the amount of PCBs on a particular surface area were taken with Whatman filters which were then placed in a plastic vial, identified by a sample number, and employee sampled were recorded on a sampling data sheet (Ex. C-3; Tr. 43-46). Air sampling to determine the levels of employee exposure to airborne PCBs was performed with respect to four employees working in the basement area. The sampling was performed using personal sampling pumps which drew air at a specified flow rate through florisil tubes placed in the breathing zone of each employee (Tr. 32-33). To insure that the sampling pumps were drawing air at the proper flow rate, the pumps were calibrated by Mr. Grabenstein before and after sampling (Tr. 33-35). On completion of each sample, the florisil tubes were identified by a sample number and sealed (Tr. 52). Pertinent sampling data such as

the name and job description of the employee sampled, the sampling number, sampling time, volume sampled, and pump calibration data were recorded on sampling data sheets (Ex. C-4; Tr. 46-50).

Following the inspection, the air and wipe samples were forwarded to the OSHA Laboratory, Salt Lake City, Utah, for analysis to determine the levels of PCBs in each sample (Tr. 53-54). The samples were received by the lab with the seals intact and assigned to chemist John Lay for analysis (Tr. 361-364). The wipe and florisil samples were analyzed by gas chromotography (Ex. C-23, R-4; Tr. 359-366). The results of analysis for each sample were recorded on the sampling data sheets and thereby reported to the Cincinnati Area Office (Ex. C-4, C-4; Tr. 56, 368).

Sampling on September 17, and the analysis of those samples, revealed the following with respect to employees engaged in the handling and disposal of line capacitors:

a) Gary Smith, construction helper, was removing capacitors from a capacitor bank and attaching them to the fork lift sling for transport and placement in a container. Air sampling in his breathing zone revealed that he was exposed to airborne PCBs at levels of 0.02 milligrams per cubic meter ($mg/m^3$) over a period of 71 minutes and 0.04 $mg/m^3$ over a period of 102 minutes. A wipe sample of his arm during the work shift revealed 8.5 micrograms (ug) of PCBs and a wipe sample of his hands and arms at the end of the work shift revealed PCBs at a level of 17 ug. Furthermore, a wipe sample of oil on the side of a capacitor which he was working on revealed 32 milligrams of PCBs (Tr. 44, 64-65; Ex. C-3, wipe samples 2, 3, 6, Ex. C-4, samples GS-1, GS-2, Ex. C-7, page 1, Ex. C-6).

b) Ernie Hall, mechanic A, was removing capacitors from capacitor banks and placing a capacitor contained in a plastic bag into a steel container. Air sampling disclosed that Mr. Hall was exposed to airborne PCBs of 0.03 $mg/M^3$ over a period of 74 minutes and 0.03 $mg/m^3$ over a period of 102 minutes. A wipe sample of his hands at the end of the work shift revealed a PCB concentration of 2.7 ug. (Tr. 45-46, 67-69; Ex. C-3, wipe sample 4, Ex. C-4, samples EH-1, EH-2, Ex. C-7, p. 3 bottom photo, p. 4 bottom photo, p. 5 top photo, Ex. C-6).

c) Pat McWilliams, fork truck operator, was operating the fork truck to move large capacitors from the storage area to the disposal containers. Air sampling revealed that he was exposed to PCBs at a level of 0.02 $mg/m^3$ for 49 minutes and 0.03 $mg/m^3$ over a period of 97 minutes (Tr. 66, Ex. C-4, samples PMW-1, PMW-2, Ex. C-7, p. 3 middle photo, Ex. C-6).

d) Greg Timme, construction helper, was removing capacitors from a capacitor bank and attaching them to the fork lift sling. Air sampling disclosed that he was exposed to 0.03$mg/m^3$ of PCBs over a period of 66 minutes and 0.04 $mg/m^3$ for a 102-minute period (Tr. 60, 64-65, 69; Ex. C-4 samples GT-1, GT-2, Ex. C-7 p. 1 bottom photo, p. 5 top photo, Ex. C-6).

Evidence presented by respondent was to the effect that, since 1978 when EPA storage and disposal requirements became effective, the procedures for handling and storing capacitors was proper (Ex. C-14; Tr. 344-345, 468). At the time of the OSHA inspection, CG&E provided its employees handling the capacitors on a voluntary basis plastic aprons, leather work gloves, rubber gloves, masks, face

shields, safety goggles and respirators (Tr. 179, 469). Supervisory personnel discussed the health effects of PCBs with employees. Employees were advised to wear the personal protective equipment, to avoid getting PCB fluid on clothes or skin, to wash the skin if there was contact, and to change clothes if necessary. Employees were cautioned to wash before eating if they handled PCB and they were given the opportunity to shower and wash (Tr. 336-338A, 467-469).

Concerning the specific operation involved with the treatment of capacitors in the Dana Avenue facility, leaking capacitors were stored only in containers or in a diked area (Tr. 470). Spills of PCB fluid did not exceed a couple of tablespoons (Tr. 480) and were cleaned up promptly with Speedy Dry, solvent and rags (Tr. 472). No open vats or splashable amounts of the fluid were handled by employees (Tr. 472) and the practice of puncturing or cutting capacitors or breaking off bushings was ordered stopped in 1977-78 (Tr. 340, 470). A fork lift was used to move leaking capacitors from the diked area to containers and employees were not required to manually lift or grasp capacitors which showed evidence of leakage on their cases (Tr. 343). The only type of PCBs which were detected leaking during the inspection was 42% chlorine PCB (Ex. C-6; Tr. 124).

Respondent also challenged the accuracy of the sampling performed by Mr. Grabenstein. For example, Mr. Grabenstein failed to change gloves between taking samples of a capacitor and of employees (Tr. 100, 102, 482, 483). Mr. Messinger testified that changing gloves was good industrial hygiene practice to prevent contamination of a second sample by the first (Tr. 177). Also, the filters used by Mr. Grabenstein were moistened with water when hexane should have been used (Tr. 115, 374).

Other factors could have affected the testing. Pesticides and petroleum products which are chlorinated or contain sulfur could cloud the analysis for presence of PCBs (Tr. 374). Soap or other products used to clean the skin, if chlorinated, also might interfere with analysis (Tr. 412).

II

Item 1 of Citation 1 alleges a number of willful violations under section 5(a)(1) of the Act. In order to establish a violation of the general duty clause, the Secretary must prove that (1) the employer failed to render its workplace free of a hazard, (2) which was recognized, and (3) which was "causing or likely to cause death or serious physical harm." (National Realty & Construction Co., Inc., 489 F.2d 1257 (D.C. Cir. 1973).

Complainant's position is that PCBs are a suspected carcinogen presenting a serious human health hazard and that there is no safe level of exposure. Accordingly, the development of a safe work practices program to reduce employee exposure to the lowest extent feasible is required. This, the Secretary avers, respondent's failure to implement and enforce a safe work practices program, as specified in Item 1, constitutes a recognized hazard likely to cause death or serious physical harm.

According to complainant, the hazards presented by PCBs to the environment and human health have been widely recognized and publicized. By passage of Section 6e of the Toxic Substances Control Act of 1976 (TSCA), Congress regulated the manufacture, processing, distribution in commerce, and use of PCBs (Ex. C-13). Rules concerning the disposal and marking of PCBs were issued by EPA and published in the Federal Register (Ex. C-14, C-15, C-16). The Electric Power Research Institute, Inc., (EPRI), of which CG&E is a member, published a series of

reports concerning the disposal of PCBs and PCB-contaminated materials (Ex. C-17; Tr. 165). The National Institute for Occupational Safety and Health (NIOSH) issued various reports on the subject (Ex. C-8, C-11, C-12).

Dr. Renate D. Kimbrough, M.D., a toxicology expert, testified concerning extensive research on the effects of PCBs upon certain animal species (Ex. C-24; Tr. 490-501). Based upon these studies, Dr. Kimbrough determined that PCBs are a carcinogen in animals and, therefore, must be considered a suspected carcinogen in humans (Tr. 501-503).

Nothwithstanding the reliance upon the NIOSH criteria document, the Toxic Substances Control Act, USEPA regulations, etc., the objective evidence does not sustain complainant. Dr. Kimbrough testified only that PCBs "'may' be a carcinogen in people" (Tr. 502). She was not asked whether the PCB exposure allegedly experienced by CG&E employees was "likely to produce death or serious physical harm." She was asked if it presented "a human health risk" and her reply was that "It would add to the body burden of PCBs and in that respect, it would increase the risk. On the other hand, it's difficult to determine from just those numbers how much PCB would actually be absorbed, since we don't have . . . the surface area" (Tr. 507).

Dr. Kimbrough's research with PCBs consisted of animal feeding studies involving 54% and 60% PCBs (Tr. 499-500). She could not determine if the effects of 42% PCBs would be different from the effects of 54% and 60% PCBs because it is not known which isomers are responsible for the toxic effects (Tr. 503).

Dr. R. Emmet Kelly, a medical doctor with 35 years' experience evaluating employees exposed to PCBs in an occupational setting, testified to a reasonable medical certainty that exposure to PCBs in a capacitor-handling operation, even as

frequently as two or three times a week, with skin contact of 17 micrograms, would not create a substantial probability that death or serious physical harm could result (Tr. 534-539). The only harm which could result might be eye irritation from eye contact from splash or PCB-contaminated gloves and this would be only "de minimis" (Tr. 531, 539). Dr. Kelly performed tests in which PCBs were put into the eyes of rabbits. The effect of 100% PCB solution after two minutes in the eye were found by him to be equivalent to the effect of a 20% Ivory soap solution in the eye (Tr. 531). Dr. Kelly's experience was with employees of Monsanto Chemical who were "at a magnitude of ten or 100 times more seriously exposed" (Tr. 538).

With respect to Dr. Kimbrough's findings, Dr. Kelly testified that he had evaluated her studies and disagreed with her conclusions. Her slides were reviewed by Dr. Pavis Paou, a pathologist at the Epply Institute for Cancer, University of Nebraska, and he disagreed with her findings of liver carcinoma (Ex. R-7; Tr. 540-541). And, according to Dr. Kelly, Monsanto's own animal PCB feeding studies of rats and dogs at three levels revealed no tumors (Ex. R-8; Tr. 540). Finally, subsequent to Dr. Kimbrough's report, the National Cancer Institute performed a rat feeding study with 54% PCBs and found PCBs were not carcinogenic (Ex. R-9; Tr. 548).

Considering the overall evidence, complainant has not established that employees of CG&E, at the times and places here in question, were exposed to a hazard likely to produce death or serious physical harm as required under section 5(a)(1) of the Act so as to mandate the work practices set forth in Item 1 of the citation.

Although unnecessary to resolve in view of the foregoing, respondent aptly points out that there is a specific standard for 42% PCB exposure set forth in 29

C.F.R. § 1910.1000(e) Table Z-1 (listed under chlorodiphenyls 42%). CG&E was in compliance with both the inhalation and dermal standards for 42% PCBs (Secretary's Response #4 to Request for Admissions). Chairman Cleary pointed out the well settled doctrine in Tolar Construction Co., (74 OSAHRC 85/F4, 2 BNA OSHC 1385, 1974-75 CCH OSHD ¶ 19,078 (No. 1329, 1974)): "Citing a respondent under the general duty requirement of the Act is not appropriate where there exists a specific occupational safety and health standard covering the conduct at issue."

III

Under Item 2, respondent is charged with a willful violation of 29 C.F.R. § 1910.132(a) in that CG&E did not require its employees to wear certain protective equipment, i.e., full body covering and gloves and shoe coverings. CG&E did not require the use of employees of the personal protective equipment, but it was provided on a voluntary bases.

As previously discussed in connection with Item 1, the Secretary has not established that a hazard exists from dermal contact with PCBs for the amount of exposure given in this case. CG&E was in compliance with the dermal standard for 42% PCBs. And, there is no evidence of record that any CG&E employee suffered any injury for dermal contact with PCBs.

Considering all of the evidence, I do not find the respondent in violation of 29 C.F.R. § 1910.132(a).

In view of the above finding, it is unnecessary to address respondent's arguments that the cited section was improperly promulgated or that the term "provide" does not mean "require the use of."

IV

Item 3a charges respondent with failing to comply with the provisions of 29 C.F.R. § 1910.133(a)(1) relating to protective eye and face equipment.

In view of the previous findings, the issue of eye protection need only be addressed here. According to Dr. Kelly, the only harm which could result from eye contact with PCB would be irritation which he described as de minimis. He did not consider the substance corrosive (Tr. 531) and Dr. Kimbrough admitted it was not in the sense that it would cause severe ulceration (Tr. 510). A violation is properly characterized as de minimis when it has only a negligible relationship to safety and health and where it is inappropriate to require that the violation be abated or to assess a penalty. National Rolling Mills Co., 76 OSAHRC 121/D7, 4 BNA OSHC 1719, 1976-77 CCH OSHD ¶ 21,114 (No. 7987, 1976); Hood Sailmakers, Inc., 77 OSAHRC 212/C12, 6 BNA OSHC 1206, 1977-78 CCH OSHD ¶ 22,422 (No. 13996, 1977).

Under the circumstances, the failure to require employees to use eye protection was, at most, a de minimis violation.

Under Item 3b, respondent is charged under 29 C.F.R. § 1910.151(c) with failing to provide eye wash and body shower facilities in the work area for quick flushing or drenching of eyes and body. CG&E did provide eye wash and shower facilities within one minute's walking distance of the basement capacitor handling area (Tr. 472-473).

Since the evidence was not established that a hazard from PCB dermal contact existed under the facts here and that eye contact would cause more than minor irritation, no necessity appears to require that such facilities be made available right in the work site. Accordingly, the citation must fail.

V

I reach the following findings of fact and conclusions of law:

FINDINGS OF FACT

1. Respondent is a utility company doing business in the Cincinnati, Ohio, area. In the basement of its Material and Repair Building at Dana Avenue,

Cincinnati, line capacitors removed from service are stored pending disposal. The capacitors of varying sizes, containing polychlorinated biphenyls (PCBs), are stored in diked areas. Some capacitors are contained in 55-gallon drums or plastic bags and some are stored without any type of container or cover.

2. The handling operation of capacitors in preparation of disposal is performed one or two times a month, requires three to four hours to complete, and involves three or four employees. On one occasion during the inspection, 15% were found by the compliance officer to be leaking oil.

3. Sampling to determine the presence of PCBs and the levels of employee exposure to PCBs was performed on August 31 and September 17, 1979.

4. Air levels measured during the inspection did not exceed the limits set forth in 29 C.F.R. § 1910.1000, Table Z(1).

5. Wipe samples were taken from capacitors in the area and from two emloyees which upon testing revealed presence of 42% PCB. Results of wipe samples from two other employees showed no PCB contact. The dermal exposure of the employees with positive tests did not exceed the limits set forth in 29 C.F.R. § 1910.1000(e) Table Z-1 (listed under chlorodiphenyls 42%).

6. At the time of the inspection, CG&E provided its employees on a voluntary basis plastic aprons, leather work gloves, rubber gloves, masks, face shields, safety goggles and respirators. Employees were advised to wear personal protective equipment, avoid getting PCB on clothes or skin, to wash the skin if there was contact, and to change clothes if necessary. Employees were cautioned to wash before eating if they handled PCBs and they were given the opportunity to shower and wash. Eye wash and shower facilities were provided which were within one minute's walking distance from the work area.

7. The probative evidence of record does not establish that the exposure of CG&E employees to the levels of 42% PCBs reflected by tests in this case would create a hazard likely to produce death or serious physical harm.

8. The probative evidence does not establish that impervious personal protective equipment, i.e., full body covering and gloves and shoe coverings, should be required to be used by employees when handling capacitors containing PCBs.

9. The probative evidence does not establish that protective eye and face equipment should be required to be used by employees when handling capacitors containing PCBs.

10. The probative evidence does not establish that eye wash and body shower facilities be provided in the immediate work area for employees handling capacitors containing PCBs.

11. There existed a remote possibility of employees having eye contact with PCBs from splashes or gloves, but such contact would result only in minor eye irritation.

## CONCLUSIONS OF LAW

1. Respondent is engaged in a business affecting commerce within the meaning of the Act and this Commission has jurisdiction over the subject matter and parties to this action.

2. Respondent at the times and place in question was not in violation of section 5(a)(1) of the Act.

3. Respondent at the time and place in question was not in violation of section 5(a)(2) of the Act by failing to comply with the provisions of 29 C.F.R. § 1910.132(a), 29 C.F.R. § 1910.133(a)(1) (relating to face equipment), 29 C.F.R. § 1910.151(c), and 29 C.F.R. § 1910.134(a)(2).

4. The respondent failed to comply with the provisions of 29 C.F.R. § 1910.133(a)(1) as to eye protection; however, the violation was de minimis.

## ORDER

Based upon the foregoing findings of fact and conclusions of law, Citation 1 is vacated except as to Item 3a relating to eye protection which is affirmed as a de minimis violation only.

SO ORDERED.

Dated this 12th day of November, 1980.

DECISION

Before: ROWLAND, Chairman; CLEARY and COTTINE, Commissioners.

BY THE COMMISSION:

These cases concern ex parte warrants obtained by the Secretary of Labor in early 1980 to inspect the workplaces of Smith Steel Casting Company in Marshall, Texas, and Compressor Engineering Corporation in Houston, Texas. The Secretary made the ex parte applications under his regulation at 29 C.F.R. § 1903.4 as amended in December 1978.[1/] The Respondents contend

---

1/ The regulation at issue, 29 C.F.R. § 1903.4, as amended in 1978, provides in pertinent part as follows:

(continued on next page)

that this regulation is invalid and moved that the evidence gathered during the inspections be suppressed. Judge Edwin G. Salyers in Docket Nos. 80-2069 and 80-2322 (Smith Steel Casting Company) and Judge E. Carter Botkin in Docket No. 80-2775 (Compressor Engineering Corporation), upheld the Respondents' contentions, relying on Donovan v. Huffhines Steel Co., 645 F.2d 288 (5th Cir. Unit A, 1981). See also Cerro Metal Products v. Marshall, 620 F.2d 964 (3d Cir. 1980). But see Marshall v. Seaward International, Inc., 644 F.2d 880 (4th Cir. 1981) (table), aff'g 510 F. Supp. 314 (W.D. Va. 1980); Rockford Drop Forge Co. v. Donovan, 672 F.2d 626 (7th Cir. 1982); W & W Steel Co. v.Marshall, 604 F.2d 1322 (10th Cir. 1979). The Secretary's petitions for review in both cases were granted.[2/]

---

1/ (continued)

§ 1903.4 Objection to inspection

(a) Upon a refusal to permit a Compliance Safety and Health Officer, in exercise of his official duties, to enter without delay and at reasonable times any place of employment or any place therein, to inspect, . . . [he] shall endeavor to ascertain the reason for such refusal, and shall immediately report the refusal and the reason therefor to the Area Director. The Area Director shall consult with the Regional Solicitor, who shall take appropriate action, including compulsory process, if necessary.

* * *

(d) For purposes of this section, the term compulsory process shall mean the institution of any appropriate action, including ex parte application for an inspection warrant or its equivalent.

2/ The cases are before the Commission for review pursuant to 29 U.S.C. § 661(i). Commissioner Cottine granted the Secretary's petition in Docket Nos. 80-2069 and 80-2322. Commissioner Cleary granted the Secretary's petition in Docket No. 80-2775. Because the cases present the same issue, the Commission has consolidated them for purposes of review. Commission Rule 9, 29 C.F.R. § 2200.9.

The Commission has held that the Secretary had authority under section 1903.4 as amended in 1978 to obtain ex parte warrants. Roberts Consolidated Industries, Inc., OSHRC Docket Nos. 80-2423 and 80-2860 (June 30, 1982). See also Davis Metal Stamping, Inc., OSHRC Docket No. 78-5775 (June 30, 1982). This Commission precedent controls the disposition of these cases. The Secretary was authorized to obtain the ex parte warrants and the inspections conducted under the warrants were valid. Furthermore, for the reasons set forth in Davis Metal Stamping, Inc., we do not read the opinion in Donovan v. Huffhines Steel Co., supra, to require the Commission to reach a contrary result in the disposition or remedy in this case. We therefore set aside the judges' decisions[3/] and remand the cases to the respective judges for further proceedings consistent with this opinion.[4/] SO ORDERED.

FOR THE COMMISSION

Ray H. Darling, Jr.

RAY H. DARLING, JR.
EXECUTIVE SECRETARY

DATED: JUN 30 1982

---

3/ Chairman Rowland concludes that the Secretary improperly obtained the warrants in these cases and would vacate the Secretary's citations for the reasons stated in his dissenting opinions in Roberts Consolidated Industries and Davis Metal Stamping.

4/ Docket No. 80-2775 (Compressor Engineering Corporation) is hereby severed from Docket Nos. 80-2069 and 80-2322 (Smith Steel Casting Company). Commission Rule 10, 29 C.F.R. § 2200.10.

Robert D. Moran, Esquire, Washington, D. C., on behalf of the respondent.

Ernest F. Smith, Esquire, Marshall, Texas, on behalf of the respondent.

## DECISION AND ORDER

SALYERS, Judge: On January 22, 1980, Industrial Hygienist Jack M. Matthews, Jr., an employee of the Occupational Safety and Health Administration, conducted a walk-around inspection of Smith Steel Casting Company (hereinafter respondent) in Marshall, Texas. The purpose of the inspection was to determine if respondent's employees were exposed to excessive levels of noise and air contaminates in contravention of the Occupational Safety and Health Act (29 U.S.C. § 651, et seq.). The respondent offered no resistance to this initial inspection. Matthews was accompanied on the walk-around by respondent's Vice-President, Ms. Geraldine Mauthe.

Matthews first visited the core-making area where sand is mixed for use in respondent's operations and noticed visible quantities of silica dust had accumulated on the person and clothing of employees working in this area (Tr. 48–49). He then moved to the floor molding area where he observed employees making molds using a sand ramming tool and concluded these employees were potentially exposed to high levels of silica dust (Tr. 55). The next area where Matthews noted a potential hazard was in the furnace area. There he noticed a great deal of noise was created when electric arcs were lowered into the furnace to initiate the melting process (Tr. 58). Using a sound level meter he also determined potential excess noise levels in the finishing area (Tr. 61). He further noted in the finishing area an employee using an electric arc welding machine with a copper coated electrode, and concluded this could cause a potential for excess levels of copper fumes (Tr. 62).

At the completion of the walk-around inspection, Matthews conferred with respondent's Vice-President and informed her of his findings. He explained his preliminary conclusions indicated employee exposure to excessive noise levels, silica dust and copper fumes. However, to confirm his suspicions, he further advised it would be necessary for him to return the following day to conduct additional testing (Tr. 79).

The following day, January 23, 1980, an associate of Matthews, Mr. Thornhill,[1/] returned to respondent's establishment for the purpose of conducting additional testing for excessive noise levels. Upon his arrival, he was advised by Ms. Mauthe and Mr. Gerald Smith, respondent's President, that continuation of the

---

1/ Matthews was unavailable on this date since he had been summoned for jury duty.

inspection would not be permitted. At that point, Mr. Thornhill left the premises and returned to his office (Tr. 95).

On February 25, 1980, the Secretary of Labor (hereinafter Secretary) applied for an inspection warrant to the United States District Court, Eastern District of Texas, Tyler Division. While the Secretary supported his request with an affidavit of his hygienist, the proceeding was ex parte. United States Magistrate Houston Abel issued the requested warrant and it was upon the basis of this ex parte warrant that the Secretary conducted a further inspection of respondent which has become the subject matter of this case.

Counsel for respondent has vigorously maintained throughout this proceeding that the use of an ex parte warrant by the Secretary was an illegal act and that all evidence obtained by use of this warrant should be suppressed.

Section 8(g)(2) of the Act [2/] empowers the Secretary to promulgate such "rules and regulations" needed to carry out inspections under the Act. However, Congress did not specifically provide the Secretary in the statute with authority to conduct a search of an employer's place of business. In keeping with the mandate of the statute, the Secretary adopted and promulgated a regulation to deal with a situation where an employer refuses to permit inspection. On September 4, 1971, the Secretary published 29 C.F.R. § 1903.4 [3/] which empowered his agents to take "appropriate action" in such cases including "compulsory process." The term "compulsory process" was not defined.

---

2/ Section 8(g)(2) of the Act states:
"The Secretary and the Secretary of Health, Education and Welfare shall each prescribe such rules and regulations as he may deem necessary to carry out their responsibilities under this Act, including rules and regulations dealing with the inspection of employer's establishment."

3/ 29 C.F.R. § 1903.4 states:

This regulation came under attack in 1978 when the Supreme Court decided Marshall v. Barlow's, Inc., 436 U.S. 307 (1978). In addressing the Secretary's argument that effective enforcement of the Act required warrantless searches, the Court stated:

> "Indeed, the kind of process sought in this case and apparently anticipated by the regulation provides notice to the business operator. [Footnote omitted.] If this safeguard endangers the efficient administration of OSHA, the Secretary should never have adopted it, particularly when the Act does not require it. Nor is it immediately apparent why the advantages of surprise would be lost if, after being refused entry, procedures were available for the Secretary to seek an ex parte warrant and to reappear at the premises without further notice to the establishment being inspected. [The Court then states in a footnote: "Insofar as the Secretary's statutory authority is concerned, a regulation expressly providing that the Secretary could proceed ex parte to seek a warrant or its equivalent would appear to be as much within the Secretary's power as the regulation currently in force and calling for "compulsory process."] (436 U.S. at 318–320; emphasis supplied.)"

While the foregoing quotation is dictum since it was not directed to the specific issue in the case (i.e. warrantless searches), it was, apparently, taken seriously by the Secretary. On December 22, 1978, shortly after the Barlow's

---

3/ 29 C.F.R. § 1903.4

"Upon a refusal to permit a Compliance Safety and Health Officer, in the exercise of his official duties, to enter without delay and at reasonable times any place of employment or any place therein, to inspect, to review records, or to question any employer, owner, operator, agent, or employee, in accordance with § 1903.3, or to permit a representative of employees to accompany the Compliance Safety and Health Officer during the physical inspection of any workplace in accordance with § 1903.8, the Compliance Safety and Health Officer shall terminate the inspection or confine the inspection to other areas, conditions, structures, machines, apparatus, devices, equipment, materials, records, or interviews concerning which no objection is raised. The Compliance Safety and Health Officer shall endeavor to ascertain the reason for such refusal, and he shall immediately report the refusal and the reason therefor to the Area Director. The Area Director shall immediately consult with the Assistant Regional Director and the Regional Solicitor, who shall promptly take appropriate action, including compulsory process, if necessary."

decision, the Secretary amended 29 C.F.R. § 1903.4 by defining the term "compulsory process" to include "ex parte application for an inspection warrant." 42 Fed. Reg. 59, 839 (December 22, 1978). This amendment, however, was made without prior notice and the opportunity to comment as required by the Administrative Procedures Act, 5 U.S.C. § 553. This section provides an exemption for "interpretive rules" which the Secretary asserts was his intention in adopting the amendment. 4/

It is well established that regulations which are properly issued in accordance with the Administrative Procedures Act have the force and effect of law. However, interpretive rules are not binding on the Courts and while Courts may defer to them "they are always free to choose otherwise." Joseph v. U.S. Civil Service Commission, 554 F.2d 1140 at 1154 n. 26 (D.C. Cir. 1977).

Conflicting views on the effect of the Secretary's 1978 amendment of 29 C.F.R. § 1903.4 have emerged in various District Court and Appellate decisions. The law is presently far from settled.

Both the Ninth and Tenth U. S. Circuit Courts of Appeal have agreed with the

---

4/ 5 U.S.C. § 553(b) states in pertinent part:

> "General notice of proposed rule making shall be published in the Federal Register, unless persons subject thereto are named and either personally served or otherwise have actual notice thereof in accordance with law. The notice shall include—
>
> (1) a statement of the time, place, and nature of public rule making proceedings;
>
> (2) reference to the legal authority under which the rule is proposed; and
>
> (3) either the terms or substance of the proposed rule or a description of the subjects and issues involved.
>
> Except when notice or hearing is required by statute, this subsection does not apply—
>
> "(A) to interpretative rules, general statements of policy, or rules of agency organization, procedure, or practice . . ."

Secretary's position that his 1978 amendment of 29 C.F.R. § 1903.4 to include ex parte warrants was an interpretive rule not subject to the rule making process of the Administrative Procedures Act. Thus, they have held that ex parte warrants issued after the amendment were a valid exercise of the Secretary's authority. Marshall v. W. W. Steel Co., Inc., 604 F.2d 1322 (10th Cir. 1979); Stoddard Lumber Co., Inc., 627 F.2d 984 (9th Cir. 1980). See also, Amoco Oil Co., 469 F. Supp. 1234 (S.D. Tex. 1979), 1980 CCH OSHD ¶ 24,789.

On the other hand, the Third Circuit and, most recently, the Fifth Circuit, have taken contrary views. In Cerro Metal Products v. Marshall, 620 F.2d 964 (3rd Cir. 1980), the Court held that the Secretary's attempt to amend the regulation in 1978 by characterizing the change as an "interpretive rule" (and thereby exempt how the rule making process of the Administrative Procedures Act) rather than a "legislative rule" was a nullity, although the Court recognized the Secretary had "the delegated power to issue a legislative rule on the matter." The Court in Marshall v. Huffhines Steel Co., 488 F. Supp. 995 (D.C. N.D. Tex. 1979) followed the reasoning of Cerro. This District Court decision was affirmed by the Fifth Circuit. Donovan v. Huffines Steel Co., 652 F.2d 288 (5th Cir. May 15, 1981). 5/

The rationale of the Huffines case is controlling in this matter since the case at hand is venued in the Fifth Circuit. The undersigned is constrained to conclude that the Secretary's use of an ex parte warrant at a time prior to legally amending the regulation to include such a procedure was an invalid act. The evidence in this case will, therefore, be suppressed and the Secretary's Complaint will be dismissed.

---

5/ As pointed out in Judge Rubin's concurring opinion, the question has now become moot. On October 3, 1980, the Secretary, after following the rule making processes of the Administrative Procedures Act, changed the regulations to include ex parte warrants. 45 Fed. Reg. 65, 916-24.

| SECRETARY OF LABOR,<br><br>Complainant,<br><br>v.<br><br>ROBERTS CONSOLIDATED INDUSTRIES, INC.,<br><br>Respondent. | OSHRC Docket Nos. 80-2423 & 80-2860 |

DECISION

Before ROWLAND, Chairman; CLEARY and COTTINE, Commissioners.

BY THE COMMISSION:

A decision of Administrative Law Judge James D. Burroughs is before the Commission for review pursuant to section 12(j), 29 U.S.C. § 661(i), of the Occupational Safety and Health Act of 1970, 29 U.S.C. §§ 651-678 ("the Act"). In his decision, Judge Burroughs denied a motion by Respondent, Roberts Consolidated Industries, Inc., to suppress evidence obtained as the result of an allegedly illegal search of Respondent's facility conducted by the Secretary of Labor ("the Secretary"). The judge rejected Respondent's contention that the search warrant purportedly authorizing the Secretary's inspection was invalid because the warrant was sought and obtained on an ex parte basis. He concluded that the warrant was obtained pursuant to the Secretary's regulation at 29 C.F.R. § 1903.4, as amended in December 1978, and that the amendment "was effective and in force on the date when the warrant was issued in the present case." 1/ Both

1/ The regulation at issue, 29 C.F.R. § 1903.4, as amended in 1978, provides in pertinent part as follows:

§ 1903.4 Objection to inspection

(a) Upon a refusal to permit a Compliance Safety and Health Officer, in exercise of his official duties, to enter without delay and at reasonable times any place of employment or any place therein, to inspect, . . . [he] shall endeavor to ascertain the reason

parties petitioned for review of differing aspects of the judge's decision. Commissioner Cottine granted Respondent's petition in part, specifically limiting review to the following issue:

> Whether the judge erred in denying the Respondent's motion to suppress evidence on the ground that the Secretary properly obtained an ex parte warrant, despite the Respondent's advance request for notice and opportunity to be heard at the warrant hearing.

For the reasons stated below, we uphold the judge's determination that the warrant here was validly issued.

I

In November 1979, Occupational Safety and Health Administration ("OSHA") compliance officers attempted to inspect a workplace operated by Respondent, a manufacturer of adhesives, in Dayton, Ohio. The compliance officers were denied entry by Respondent's plant manager, who explained that it was company policy not to allow an inspection without a search warrant. The following day, the plant manager telephoned one of the OSHA compliance officers to advise him that Respondent wished to have its attorneys present whenever OSHA attempted to obtain a warrant. 2/ In April 1980, the Secretary sought and obtained a warrant to inspect Respondent's premises. Representatives of Respondent were not informed

---

(Footnote 1 cont'd)

> for such refusal, and shall immediately report the refusal and the reason therefor to the Area Director. The Area Director shall consult with the Regional Solicitor, who shall take appropriate action, including compulsory process, if necessary.
>
> * * *
>
> (d) For purposes of this section, the term compulsory process shall mean the institution of any appropriate action, including ex parte application for an inspection warrant or its equivalent.

2/ Respondent also wrote to the U.S. Magistrates in Dayton and Cincinnati, Ohio, requesting that it be permitted to appear at any proceeding scheduled as a result of OSHA's application for a search warrant to inspect the Dayton facility.

that a warrant was being sought, and none were present at the hearing concerning the issuance of the warrant. The Secretary subsequently served the warrant on Respondent, inspected the plant, and issued two separate citations alleging Respondent's failure to comply with various occupational safety and health standards. 3/

II

The regulation at issue, 29 C.F.R. § 1903.4 as amended in 1978 without formal rulemaking proceedings, authorizes the Secretary by its express terms to seek and obtain search warrants on an ex parte basis. The issue before us is whether the regulation itself is invalid, thereby rendering invalid the warrant issued under the regulation. Resolution of this issue turns on the question of whether the Secretary's 1978 amendment of 29 C.F.R. § 1903.4 was an interpretative rule, as argued by the Secretary and concluded by the judge, or an improperly promulgated substantive change of the pre-existing rule, as argued by Respondent. See Marshall v. Huffhines Steel Co., 488 F. Supp. 995, 1000 (N.D.Tex. 1979), aff'd, 645 F.2d 288 (5th Cir. 1981).

The regulation originally published at 29 C.F.R. § 1903.4 instructed the Secretary's agents "to promptly take appropriate action, including compulsory process, if necessary" whenever an employer refused to permit a compliance officer to conduct an inspection. The key term "compulsory process" was not defined. In December 1978, the Secretary amended section 1903.4 by adding a definition of the term "compulsory process" to mean "the institution of any appropriate action, including ex parte application for an inspection warrant or its equivalent." 43 Fed. Reg. 59,838, 59,839 (Dec. 22, 1978)(29 C.F.R. § 1903.4(d) (1979)). In

---

3/ Following Respondent's filing of a separate notice of contest as to each citation, the two cases were assigned docket numbers 80-2423 and 80-2860, respectively. The cases were ordered consolidated prior to the hearing before Judge Burroughs. At the beginning of the hearing, Respondent moved to suppress the evidence on the ground that the search warrant was invalid. The judge reserved ruling on the motion, which he subsequently denied in his decision. Accordingly, the case was fully litigated and decided on the merits of the alleged violations. In his decision, Judge Burroughs affirmed the citation in Docket No. 80-2423 and affirmed in part and vacated in part the citation in Docket No. 80-2860. The judge's disposition of these citations on the merits is not before us.

explaining this change, the Secretary indicated that he had always intended "compulsory process" to include ex parte warrants and that his agents in the past routinely had sought and obtained warrants in ex parte proceedings. 43 Fed. Reg. at 59,839. The Secretary therefore stated that notice and comment rulemaking was unnecessary for this "interpretative rule." Id. 4/

Respondent's argument in this case that the 1978 amendment was invalid is based on the reasoning and the holdings of the courts in Marshall v. Huffhines Steel Co., supra, and in Cerro Metal Products v. Marshall, 620 F.2d 964 (3rd Cir. 1980). Both courts concluded, contrary to the Secretary's assertion, that the original 29 C.F.R. § 1903.4 did not authorize the Secretary to obtain ex parte warrants. Accordingly, they further concluded that the 1978 amendment was not an interpretation of the term "compulsory process" as it was used in the original regulation. Instead, the courts viewed the amendment as a substantive change in the law that could be accomplished only through notice and comment rulemaking.

III

We reject Respondent's contention that we should adopt the position of the courts in Cerro Metal Products and Huffhines Steel. In Davis Metal Stamping, Inc., OSHRC Docket No. 78-5775 (June 30, 1982), we recently interpreted the original regulation at 29 C.F.R. § 1903.4, which is the predecessor to the regulation that

---

4/ The Administrative Procedure Act provides in pertinent part, at 5 U.S.C. § 553(b):

> General notice of proposed rule making shall be published in the Federal Register, unless persons subject thereto are named and either personally served or otherwise have actual notice thereof in accordance with law. The notice shall include—
>
> (1) a statement of the time, place, and nature of public rule making proceedings;
>
> * * *
>
> Except when notice or hearing is required by statute, this subsection does not apply—
>
> (A) to interpretative rules . . . .

is now before us. We concluded that the Secretary was authorized under the original regulation to seek and obtain search warrants on an ex parte basis. In reaching this conclusion, we expressly considered and declined to follow the reasoning of the Cerro Metal Products and Huffhines Steel courts with respect to the proper interpretation of the original section 1903.4. Accordingly, having previously rejected the premise of those courts that the Secretary had no authority under the original regulation to obtain ex parte warrants, we now reject their conclusion that the 1978 amendment constituted a substantive change in the law. We accept the Secretary's characterization of the 1978 amendment as an interpretative rule based on our own conclusion that the amendment merely stated expressly what was already implicit in the regulation, i.e., that the Secretary was empowered to obtain search warrants in an ex parte proceeding. Davis Metal Stamping, Inc., supra. 5/ In addition, we note that our determination in this case is supported by the holdings of a majority of those United States courts of appeals that have considered the validity of the regulation at issue. Rockford Drop Forge Co. v. Donovan, 672 F.2d 626 (7th Cir. 1982); Marshall v. Seaward International, Inc., 510 F. Supp. 314 (W.D. Va. 1980), aff'd without published opinion, 644 F.2d 880 (4th Cir. 1981); Marshall v. W & W Steel Co., 604 F.2d 1322, 1325-6 (10th Cir. 1979). 6/

---

5/ For the reasons stated in his dissenting opinion in Davis Metal Stamping, Inc., Chairman Rowland agrees with the holdings of the Third and Fifth Circuits in Cerro Metal Products and Huffhines Steel that the Secretary's original regulation did not authorize him to obtain warrants ex parte. Accordingly, in the Chairman's view those courts also properly held that the Secretary's 1978 amendment purporting to interpret his authority under that regulation was without force and effect.

Chariman Rowland also observes that, as in Davis Metal Stamping, the appropriate remedy is vacation of the Secretary's citations for failure of the Secretary to comply with his own regulation rather than suppression of the evidence obtained thereby.

6/ Our conclusion as to the validity of the ex parte warrant is not altered because of the Respondent's advance request for notice and an opportunity to be heard at the warrant hearing. A similar contention by an employer in Rockford Drop Forge Co. v. Donovan, supra, was rejected. The court

For the reasons stated, we affirm Judge Burroughs' holdings that the regulation at issue and the search warrant issued under it were valid. We further affirm his denial of Respondent's motion to suppress evidence.

SO ORDERED.

## DECISION AND ORDER

APPEARANCES:

Michael A. Alaimo, Esquire, Office of the Solicitor, U. S. Department of Labor, Detroit, Michigan, on behalf of complainant

Richard A. DiRose, Esquire, and Robert A. Rapp, Esquire, Dayton, Ohio, on behalf of respondent

Mr. Paul L. Bogan, President, Local 888, on behalf of authorized employee representative

BURROUGHS, Judge: Roberts Consolidated Industries, Inc., a manufacturer of adhesives, contests a serious citation issued to it on April 18, 1980 (Docket No. 80-2423), alleging a violation of 29 C.F.R. § 1910.134(d)(2)(ii), and a serious citation

issued to it on April 23, 1980[1/] (Docket No. 80-2860), alleging a violation of fourteen separate safety standards.

This action arises out of an inspection conducted by representatives of the Occupational Safety and Health Administration ("OSHA") from April 2 through April 7, 1980, pursuant to an ex parte warrant issued by a United States Magistrate. Respondent argues that OSHA did not have authority to obtain a warrant ex parte. As relief, respondent requests that the April 1980 search be declared unconstitutional and that evidence obtained during the search be suppressed. Additionally, respondent seeks to have the evidence suppressed for complainant's failure to allow a closing conference at the completion of the inspection. A motion to suppress was filed by respondent at the commencement of the hearing. The motion was taken under advisement and evidence received on the issue, since the Commission has authority to decide questions concerning the validity of individual inspection warrants. Chromalloy American Corp., 79 OSAHRC 55/D11, 7 BNA OSHC 1547, 1979 CCH OSHD ¶ 23, 707 (No. 77-2788, 1979).

## MOTION TO SUPPRESS

### A. Ex Parte Warrant

In October 1979 the Cincinnati, Ohio, OSHA office received a complaint concerning possible violations of safety and health standards at respondent's plant located on 220 Janney Road, Dayton, Ohio. On November 20, 1979, Industrial Hygienist David Zwolak and three compliance officers attempted to conduct an

---

1/ Respondent also contested an "other" citation issued to it on April 23, 1980, but withdrew its notice of contest to that citation during the course of the hearing (Tr. II, 24). The "other" citation alleged a violation of 29 C.F.R. § 1910.178(a)(6).

inspection at the Janney Road plant. Upon identifying themselves to George Stockham, the plant manager, they were advised that it was company policy to decline to allow an inspection without a search warrant. Zwolak and the three compliance officers voluntarily left the premises but indicated they would return with a search warrant (Tr. II, 132, 136-137).[2/]

On November 21, 1979, upon the advice of counsel, Stockham telephoned Zwolak to advise him that respondent wanted their attorneys present whenever OSHA attempted to obtain a warrant (Tr. II, 136-137). The Cincinnati, Ohio, OSHA office referred the matter to the Solicitor's Office for assistance in obtaining the warrant (Tr. II, 132, 135, 137). Representatives of respondent were not informed that a warrant was being sought, and none were present during the hearing on the issuance of the warrant (Tr. II, 137-138). Armed with the warrant, Compliance Officers James Zucchero and Paula Moore and Industrial Hygienist James Sweeney commenced an inspection of respondent's plant on April 2, 1980.

Respondent argues that 29 C.F.R. § 1903.4, both as originally promulgated and as amended, does not authorize the Secretary to apply for OSHA inspection warrants ex parte. It asserts that the Supreme Court's decision in Marshall v. Barlow's, Inc., 436 U. S. 307 (1978), stated that 29 C.F.R. § 1903.4, as it existed at the time of the decision, did not authorize the Secretary to obtain ex parte warrants and that the subsequent amendment of section 1903.4 was invalid since it was not issued in accordance with the notice and comment procedures of section 4 of the Administrative Procedures Act. Respondent relies principally upon the decision and the reasoning of the court in Cerro Metal Products v. Marshall, 620

---

2/ The hearing was held on September 8 and 9, 1980. For some unexplained reason, each day's transcript commences with page one. The reference to "Tr. I" is used to refer to the transcript for September 8, 1980. The use of "Tr. II" refers to the transcript for September 9, 1980.

F.2d 964 (3rd Cir. 1980). The Third Circuit, in affirming the District Court's granting of a preliminary injunction prohibiting OSHA from obtaining ex parte warrants to inspect the employer's workplace, placed great weight upon the Supreme Court's dictum in Barlow's that "the kind of process . . . apparently anticipated by . . . regulation [§ 1903.4] provides notice to the business operator." 436 U. S. at 318. The Third Circuit recognized that the Supreme Court's interpretation of section 1903.4 may well be technically categorized as dictum but chose to follow it "as a matter of sound judicial policy" and concluded that section 1903.4, as originally promulgated, "did not empower OSHA to seek ex parte warrants." 620 F.2d at 979.

There is no congressionally enacted statute specifically authorizing the Secretary to conduct a search of an employer's place of business. However, section 8(g)(2) of the Act [29 U.S.C. § 657(g)(2)] states that the Secretary shall prescribe rules and regulations dealing with the inspection of an employer's establishment.[3/] Pursuant to section 8(g)(2), the Secretary, in 1971, after notice and comment, promulgated 29 C.F.R. § 1903.4,[4/] which outlined the steps to be followed by a compliance officer when an employer refused him entry.

---

3/ Section 8(g)(2) of the Act in its entirety is as follows:

> The Secretary and the Secretary of Health, Education, and Welfare shall each prescribe such rules and regulations as he may deem necessary to carry out their responsibilities under this Act, including rules and regulations dealing with the inspection of an employer's establishment.

4/ Section 1903.4 of 29 C.F.R., as promulgated in 1971, provided that, upon refusal of a company to permit a compliance officer to enter or to permit a representative of the employees to accompany him on an inspection, the officer was to terminate the inspection or to confine the inspection to areas where no objection was raised. In the event of a refusal, the officer was to try and determine the reason for refusal and immediately report to his area director. The area director was required to consult with the Assistant Regional Director and the Regional Solicitor, "who shall promptly take appropriate action, including compulsory process, if necessary."

The Supreme Court rendered its opinion in Marshall v. Barlow's, Inc., supra, in January of 1978. The Court dealt at length with 29 C.F.R. § 1903.4 and, in the final analysis, concluded that the Act was unconstitutional insofar as it purported to authorize inspections without a warrant or its equivalent. 436 U. S. at 325. The Court indicated that "the kind of process sought in this case and apparently anticipated by the regulations [§ 1903.4] provides notice to the business operator." 436 U. S. at 318. The Court indicated in a footnote that a regulation expressly providing for ex parte warrants would be within the Secretary's statutory authority.[5/] Following the opinion of the Court in Barlow's, the Secretary, effective December 22, 1978, amended 29 C.F.R. § 1903.4, without notice and comment, to define the term "compulsory process" appearing in that regulation to include ex parte warrants.[6/] The rulemaking process provided by the

---

5/ Note 15 set forth in 436 U. S. at 320 states:

> Insofar as the Secretary's statutory authority is concerned, a regulation expressly providing that the Secretary could proceed ex parte to seek a warrant or its equivalent would appear to be as much within the Secretary's power as the regulation currently in force and calling for "compulsory process."

6/ Section 1903.4(d) states:

> For purposes of this section, the term compulsory process shall mean the institution of any appropriate action, including ex parte application for an inspection warrant or its equivalent.

Administrative Procedures Act, 5 U.S.C. § 553, was not followed in the adoption of the amendment. The Secretary considered the amendment an interpretative rule exempt from rulemaking by 5 U.S.C. § 553(b).[7/]

Under the 1978 amendment to 29 C.F.R. § 1903.4, the Secretary may apply, ex parte, for the issuance of an inspection warrant and legal notice need not be given the employer before such issuance. The warrant in this case was issued April 1, 1980, some fifteen months after the amendment. Respondent argues that the 1978 amendment was not properly promulgated for failure to comply with the notice and comment procedures of the Administrative Procedures Act and, in thus arguing, relies on Cerro Metal Products v. Marshall, supra, and Marshall v. Huffhines Steel Co., 478 F.Supp. 986 (N. D. Tex. 1979), appeal filed, No. 80-1017 (5th Cir. January 7, 1980).

---

7/ 5 U.S.C. § 553(b) states in pertinent part:

> General notice of proposed rule making shall be published in the Federal Register, unless persons subject thereto are named and either personally served or otherwise have actual notice thereof in accordance with law. The notice shall include—
>
> (1) a statement of the time, place, and nature of public rule making proceedings;
>
> (2) reference to the legal authority under which the rule is proposed; and
>
> (3) either the terms or substance of the proposed rule or a description of the subjects and issues involved.
>
> Except when notice or hearing is required by statute, this subsection does not apply—
>
> (A) to interpretative rules, general statements of policy, or rules of agency organization, procedure, or practice . . . .

Contrary to the opinion of the Third Circuit in Cerro Metal Products, other courts have found 29 C.F.R. § 1903.4(d) to be an interpretative rule whereby the term "compulsory process" was defined to include ex parte warrants and have held ex parte warrants to be valid. Marshall v. W & W Steel Co., Inc., 604 F.2d 1322 (10th Cir. 1979); Amoco Oil Co., 469 F.Supp. 1234, 1980 CCH OSHD ¶ 24,789 (S. D. Tex., 1979); Stoddard Lumber Co., Inc., 627 F.2d 984, 1980 CCH OSHD ¶ 24,790 (9th Cir. 1980). In W & W Steel Co., Inc., the Court stated (604 F.2d at 1325-1326):

> By its own terms the rule-making requirements of 5 U.S.C. § 553 do not apply to an interpretative rule, general statements of policy, or rules of agency organization, procedure or practice. We agree with the Secretary that 29 C.F.R. § 1903.4(d) was an interpretative rule whereby the term "compulsory process" was defined to include ex parte warrants. Such being the case, the 1978 amendment, § 1903.4(d), was effective and in force on the date when the warrant issued in the present case. (Footnote omitted)

The decision of the Court in W & W Steel Co., Inc. is considered logical and reasonable in light of the congressional mandate given to the Secretary to carry out the objectives of the Act.

The Supreme Court in Barlow's never specifically focused its attention on whether ex parte warrants were authorized. It merely addressed the "compulsory process" that the Secretary indicated he was using, and which did not involve the use of a warrant. The Third Circuit in Cerro Metal Products read more into the opinion than was intended. The Fourth Amendment does not preclude ex parte warrants, and the Supreme Court recognized in its Barlow's decision that "surprise searches" were authorized by the Act and contemplated by the regulations. 436 U. S. at 317. Nothing in the Act requires notice to the employer before acquiring a warrant. Indeed, an adversary hearing on a warrant would eliminate any element of surprise and would have the practical affect of affording an employer additional time in which to correct all violations prior to an inspection. An employer under

such circumstances would not have to worry about the day-to-day compliance expected of employers under the Act. An employer would only have to make certain conditions were in compliance on the day the inspection was conducted by warrant.

The amendment of 29 C.F.R. § 1903.4 was an interpretative rule whereby the term "compulsory process" was defined. The 1978 amendment was effective and in force on the date when the warrant was issued in the present case. Accordingly, the ex parte warrant was validly issued.

B. Closing Conference

The inspection concluded on the afternoon of April 7, 1980. At approximately 3:00 p.m. on April 7, 1980, the inspecting officers were ready to hold a closing conference pursuant to 29 C.F.R. § 1903.7(e).[8/] Respondent's plant manager, George Stockham, indicated that he was planning to tape record the closing conference. Zucchero requested that he not tape the closing session, but Stockham refused to relent. Zucchero consulted with his area director and was advised not to conduct a full closing conference if the respondent insisted on recording the conference (Tr. I, 60; Tr. II, 73-74, 138-139). Zucchero explained to Stockham and Jim Minor, the plant engineer, that the company had certain rights under the Act

---

8/ Section 1903.7(e) of 29 C.F.R. provides:

> At the conclusion of an inspection, the Compliance Safety and Health Officer shall confer with the employer or his representative and informally advise him of any apparent safety or health violations disclosed by the inspection. During such conference, the employer shall be afforded an opportunity to bring to the attention of the Compliance Safety and Health Officer any pertinent information regarding conditions in the workplace.

and left a copy of a pamphlet which advised of the right to contest, right to request an informal conference, posting requirements, etc. There was no discussion of possible violations or abatement dates.

Prior to leaving the site, Zucchero advised Stockham that it would be possible to hold a closing conference by phone and that representatives of respondent could come to Cincinnati to hold a settlement conference. Zucchero made attempts to contact Stockham by phone on April 17 and April 18, but he was unavailable. The citations were issued on April 18 and April 23, 1980 (Tr. I, 60-61; Tr. II, 74-76). The next communication between OSHA and respondent was on May 5, 1980, when Stockham called and requested a conference (Tr. I, 61; Tr. II, 76). The violations and abatement dates were discussed with Stockham during the telephone conference held on May 5, 1980 (Tr. I, 61; Tr. II, 76).

Since closing conferences are expressly required by section 1903.7(e), respondent argues that the Secretary must not be permitted to "disregard its legally mandated obligations arbitrarily." It contends that OSHA is not excused from its responsibility of holding a closing conference "merely because the company wants to accurately preserve the contents of the closing conference by recording it." Complainant argues that respondent has not shown it was prejudiced by the failure to hold a closing conference and that in any event there was substantial compliance with 29 C.F.R. § 1903.7(e) since Compliance Officer Zucchero discussed the alleged violations with Stockham by phone on May 5, 1980. This last argument ignores the basic purpose of a closing conference which is to allow an employer the opportunity to confer with the compliance officer before a citation is issued.

Area Director William Murphy gave the following explanation for not permitting the recording of closing conferences (Tr. II, 139):

> I think what it does — it creates an atmosphere wherein both the Compliance Officers, the employees and the employers representatives are not really able to talk about abatement methods, talk about solutions of those problems, and do that in a comfortable atmosphere. It creates a kind of situation where the Compliance Officer for the most part will want to go strictly by the book and that — that gets to be a very stiff collared position that most employers don't particularly like. I don't like to see it done because I think it hinders our efforts to try to establish good relations with the employers and employees.

While Compliance Officer Zucchero testified that the Field Operations Manual prohibited the use of recorders in closing conferences, no specific part of the manual has been alluded to by the complainant (Tr. II, 73-74).

The demand for an accurate record of the closing conference fortifies rather than stultifies the objectives of OSHA which must also be to reach the truth. It would appear elementary that OSHA can hardly be prejudiced by the making of an accurate record of the closing conference. The recording of the conference presented no obstacle to the achievement of all proper objectives of OSHA. Where an employer has not tried to control, direct or interfere in the inspection and has exhibited a spirit of cooperation, there would appear to be no reason that the closing conference should not be recorded.[9/]

While closing conferences are important, the failure to hold one will not result in the vacating of a citation unless the employer has been prejudiced. The Commission in Kast Metals Corp., 77 OSAHRC 173/B11, 5 BNA OSHC 1861 at 1862-63, 1977-78 CCH OSHD ¶ 22,165 (No. 76-657, 1977), commented as follows on the requirement of 29 C.F.R. § 1903.7(e):

> This procedural regulation is intended to promote the orderly conduct of safety inspections. Unless prejudicial, the relaxation or modification of such a procedural regulation does not warrant an invalidation of an

---

9/ It is possible that a tape recording of a closing conference might vary from the recollection of witnesses testifying under oath. Under such circumstances, questions might be raised as to the accuracy of the recording.

invalidation of an agency's action. See Sun Oil Company v. Federal Power Commission, 256 F.2d 233, 239 (5th Cir. 1958), cert. denied, 358 U. S. 872 (1958). Moreover, technical and harmless violations of inspection procedures should not be allowed to deter the Act's primary purpose to assure safe and healthful working conditions. Cf. Accu-Namics, Inc. v. OSAHRC, 515 F.2d 828, 833 [3 OSHC 1299] (5th Cir. 1975). In the instant case, the respondent's failure to demonstrate how it was specifically prejudiced by the failure to hold a closing conference is fatal to the respondent's contention on this matter.

Since there has been no showing of prejudice, respondent's arguments are without merit.

The motion to suppress evidence filed by respondent at the hearing is denied.

DOCKET NO. 80-2423

Item 1 - Alleged Violation of 29 C.F.R. § 1910.134(d)(2)(ii)

Respondent, at the time of the inspection, owned and operated three oil-lubricated compressors at its Janney Road facilities. The compressors were used to supply breathing air to employees whenever they were inside a confined space or vessel to perform repair work. The compressors did not have a high-temperature or carbon monoxide alarm. Respondent did not test for carbon monoxide whenever breathing air was provided by the compressors.

The compressors were not in use during the time the inspection was conducted. However, the evidence is uncontroverted that they were used on March 26, 1980, when a maintenance mechanic made a "drop" into one of respondent's mixers. The mechanic was supplied breathing air by the compressors while he was inside the vessel. He spent approximately 20 to 25 minutes inside the vessel.

Complainant submits that respondent was in violation of 29 C.F.R. § 1910.134(d)(2)(ii).[10/] The standard requires an oil-lubricated compressor be equipped with a high-temperature or carbon monoxide alarm, or both. It is uncontroverted that the three oil-lubricated compressors were not so equipped.

Respondent concedes that "there was not literal compliance with the standard." However, it argues that the use of the compressors to supply breathing air to employees during vessel entries was closely monitored. Whenever a vessel entry was made, Plant Engineer Jim Minor and another employee stood at the edge of the tank and monitored the individuals working inside. Respondent also states that another employee was stationed at the compressor which supplied the breathing air whenever a vessel entry was made.[11/] For these reasons, respondent submits that employees were not exposed to any hazard and that the procedure utilized was at least as safe as that contained in the standard.

---

10/ Section 1910.134(d)(2)(ii) of 29 C.F.R. provides:

> The compressor for supplying air shall be equipped with necessary safety and standby devices. A breathing air-type compressor shall be used. Compressors shall be constructed and situated so as to avoid entry of contaminated air into the system and suitable in-line air purifying sorbent beds and filters installed to further assure breathing air quality. A receiver of sufficient capacity to enable the respirator wearer to escape from a contaminated atmosphere in event of compressor failure, and alarms to indicate compressor failure and overheating shall be installed in the system. If an oil-lubricated compressor is used, it shall have a high-temperature or carbon monoxide alarm, or both. If only a high-temperature alarm is used, the air from the compressor shall be frequently tested for carbon monoxide to insure that it meets the specifications in paragraph (d)(1) of this section.

11/ The evidence indicates that an employee was not always present at the compressors when an entry was being made. William Lake, one of respondent's maintenance mechanics, testified that an employee was not always stationed at the compressor (Tr. I, 47). His testimony was supported by Paul Bogan, president of the union (Tr. II, 98).

The requirement for a high-temperature or carbon monoxide alarm is prefaced by the word "shall." Therefore, the requirement is mandatory and the mere monitoring of vessel entries is insufficient to satisfy the standard. Moreover, respondent's vessel entry program failed to provide the degree of protection provided by a high-temperature or carbon monoxide alarm. The air from the compressor was never tested for carbon monoxide, and the evidence indicates that an employee was not always present at the compressors when a vessel entry was made. Even when an employee was present at the compressors, the gauges on the compressors did not test for carbon monoxide in the breathing air being supplied to the employee. The violation has been established.

In order to establish a serious violation, the Secretary need only show that an accident is possible and that such an accident will most likely result in serious injury. Communications, Inc., _____ OSAHRC _____, 7 BNA OSHC 1599, 1979 CCH OSHD ¶ 23,759 (No. 76-1924, 1979). "The proper inquiry is the probability that the resulting harm will be death or serious physical harm." Automatic Sprinkler Corporation of America, _____ OSAHRC _____, 8 BNA OSHC 1385, 1980 CCH OSHD ¶ 24,495 (No. 76-5089, 1980). Carbon monoxide is recognized as a colorless and odorless gas that can cause bodily harm or death. Accordingly, the violation is deemed to be of a serious nature.

Penalties recommended by the Secretary are merely advisory. Long Mfg. Co., 554 F.2d 903 (8th Cir. 1977). The Commission, in assessing penalties, must take into consideration the employer's history, its good faith, the size of its business and the gravity of the violation. Turner Welding & Erection Company, _____ OSAHRC _____, 8 BNA OSHC 1561, 1980 CCH OSHD ¶ 24,553 (No. 16235, 1980). As to gravity, the following elements must be considered: (1) the number of employees subjected to the hazard, (2) the duration of exposure, (3) the

precautions taken against injury, and (4) the degree of probability that an injury would occur. Morrison-Knudsen & Associates, _____OSAHRC _____, 8 BNA OSHC 2231, 1980 CCH OSHD ¶ 24,953 (No. 76-1992, 1980).

One employee was lowered into a vessel which was filled with toxic fumes. He remained in the vessel for 20 to 25 minutes. Prior to the employee being lowered into the vessel, respondent stationed employees at the point of vessel entry and near the compressors to watch the pressure gauges. Respondent also tested the air for combustible gases. While none of these steps protected against carbon monoxide poisoning from the air supplied by the compressors, the employee working in the vessel could have been hoisted to safety in the event some problem developed. A penalty of $200 is assessed for the violation.

DOCKET NO. 80-2860

Item 1 - Alleged Violation of 29 C.F.R. § 1910.22(a)(1)

Complainant alleges three specific factual situations which he claims are violations of the general housekeeping standard contained in 29 C.F.R. § 1910.22(a)(1).[12/] Two of the alleged violations are based on the fact that there were buckets and tote pans stored at the platform edge adjacent to the No. 14 and 15 mixers and at the platform edge adjacent to the No. 3 and 4 mixers. The third alleged violation concerns the placing of two skids in the aisle adjacent to the northwest corner of the mixing area. The skids had 5-gallon and 55-gallon drums stacked on them.

---

12/ Section 1910.22(a)(1) of 29 C.F.R. states:

> Housekeeping. All places of employment, passageways, storerooms, and service rooms shall be kept clean and orderly and in a sanitary condition.

Compliance Officer Zucchero testified that he observed buckets, tote pans and cans stored in a "helter skelter hazardous manner" on the platform adjacent to the No. 14 and 15 mixers (Tr. I, 62). The photograph introduced as Exhibit 1 shows two metal containers, one inside the other, lying on their side over the platform toeboard. The platform was approximately 12 feet above the pit floor. Employees were observed using the platform and the work area below.

Buckets and tote pans are used during the manufacturing process. Employees carry raw materials in the buckets onto the platform. Respondent represents that the buckets were stacked in the corner of the platform adjacent to the mixers and argues that the buckets are prevented from falling from the platform by a toeboard, a center railing and a top railing. The toeboard, midrail and top rail serve as a restraint for those buckets stacked in an upright manner. However, the two buckets in question were lying over the toeboard and between the toeboard and midrail.

A pan and a piece of pipe were protruding over the toeboard at the platform edge adjacent to the No. 3 and No. 4 mixers. The pan and pipe were located between the toeboard and the midrail. The photograph introduced as Exhibit 4 clearly supports these factual determinations. The tote pans weigh approximately five pounds.

The aisle adjacent to the northwest corner of the mixing area was obstructed with empty and filled 5-gallon and 55-gallon containers sitting on skids (Ex. 5). The skids had been placed in the aisle so that containers of adhesive product could be loaded and eventually transported to the warehouse. While the aisle was obstructed, it was not completely blocked as contended by complainant. There was sufficient room to walk between two of the skids.

Section 1910.22(a)(1) states that places of employment, passageways, storerooms and service rooms shall be kept clean and orderly. The evidence fully supports a determination that all three areas referred to in the citation were not kept clean and orderly. The violation has been established.

Respondent states that the buckets and tote pans were stored in the corner of the work platforms and presented no tripping hazard to employees working on the platforms. However, the buckets, tote pans and pipe lying over the toeboards presented a hazard to any employee who might pass underneath. There is evidence to suggest that tote pans and buckets could fall from the platform as a result of the vibration produced by the nearby mixers (Tr. II, 101). The buckets and tote pans were also subject to being bumped by an employee.

Complainant alleges that the violations were serious within the meaning of section 17(k) of the Act. This determination is based on the possibility of employees tripping and falling over debris on the work platforms and by the possibility of employees underneath the platforms being struck by falling objects (Tr. I, 68). Since the buckets and tote pans were stored alongside the guardrails, there is no reason to assume that a tripping hazard is presented to employees on the platforms. The width of the platforms and amount of obstruction on the platforms are not indicated. There has also been no allegation that the platform passageways were obstructed. The real hazard is that presented to employees working underneath the platforms.

The tote pans weigh approximately five pounds. The platforms were located approximately 12 feet above the pit floor. Assuming an individual was standing on the pit floor and was 6 feet tall, the tote pan would fall only 6 feet prior to striking the employee. This is not considered sufficient to present a serious injury or to

cause the death of an employee.[13/] The location of the skids, buckets and drums in the aisle is also not considered to be a serious violation. If an employee was tripped by the skids, buckets or drums, he would simply hit the floor.

The exposure to the hazard of falling objects appears to have been rather infrequent. Employees were not constantly working in the pit underneath the edge of the platform. A penalty of $50 is assessed for the nonserious violation.

Item 2 - Alleged Violation of 29 C.F.R. § 1910.23(a)(8)(ii)

A drainage ditch located at the southwest corner of the mixing area had its covers removed. The uncovered opening was approximately 10 feet in length, 11 inches wide and approximately 8 inches deep. The ditch was not being attended by anyone nor was there any other type of guarding provided. The surrounding floor was uneven and a concrete pit, approximately 4 feet deep, was located behind the ditch. The cover had been removed in order to clean the ditch. The employee assigned to clean the ditch was cleaning in the pit. He was approximately 75 feet from the uncovered ditch.

Complainant alleges that the removal of the grate was in violation of 29 C.F.R. § 1910.23(a)(8)(ii),[14/] which requires a floor hole cover of standard strength

---

13/ Paul Bogan, the union representative, testified that three to seven employees had been hit by a tote pan or board falling off the platforms (Tr. II, 100-101). There was no evidence to indicate that any of them had been seriously injured.

14/ Section 1910.23(a)(8)(ii) of 29 C.F.R. provides:

> A floor hole cover of standard strength and construction that should be hinged in place. While the cover is not in place, the floor hole shall be constantly attended by someone or shall be protected by a removable standard railing.

and construction be hinged in place. Respondent points out that the ditch was exposed only because the grate was being cleaned. However, whenever the grate is not in place, the standard requires constant attention to the floor hole by someone or the hole must be protected by a removable standard railing.

There was one employee observed in the area. Since he was located 75 feet from the ditch, he could not constantly attend to the ditch. The opening was not protected by a standard railing. The violation has been established.

The removal of the grate from the ditch raised the spectre of a possible tripping hazard to employees passing through the area. The seriousness of the violation was compounded by the fact a concrete pit was located approximately 15 inches from the edge of the drainage ditch. The pit was 4 feet deep. An employee tripping over the unprotected ditch could lose his footing and fall head first into the pit. Admittedly, this is an unlikely scenario but such was possible and must be considered in determining whether the violation was serious. The violation was serious.

In arriving at a penalty, complainant points out that as many as twenty persons a day frequented the area where the grate was removed. There was only one employee in the area at the time of the inspection, and he was engaged in cleaning operations in the pit. There is no indication as to how long the grate was removed or how many employees were in the area while the grate was removed. A penalty of $150 is assessed for the violation.

Item 3 - Alleged Violation of 29 C.F.R. § 1910.106(b)(3)(iv)(a)

The east yard area of respondent's facilities contained vent pipe outlets from underground tanks. The tanks contained adhesives that were of a Class I flammable nature. Compliance Officer Zucchero testified that one of the vent pipes used for

an underground tank was completely blocked or plugged by solidified adhesive (Tr. I, 86-87). This conclusion was reached by him after he personally inspected the vent opening (Tr. II, 86). A photograph (Ex. 8) was taken to show the condition of the vent.

Complainant alleges that the blocked vent pipe constituted a violation of 29 C.F.R. § 1910.106(b)(3)(iv)(a).[15/] The specific allegation by complainant concerns the fact that the vent outlet was blocked. Respondent submits that the standard is inapplicable to the facts. It is pointed out that the standard applies to the location and design of vent pipes. Respondent's vent pipes met all requirements of the standard in that the pipes were constructed at the proper height above adjacent ground level and dispersed vapors in an upward direction.

Complainant appears to place emphasis on that part of the standard which states: "[v]ent pipes shall discharge only upward in order to disperse vapors."[16/]

---

15/ Section 1910.106(b)(3)(iv)(a) of 29 C.F.R. provides:

> Location and arrangement of vents for Class I liquids. Vent pipes from tanks storing Class I liquids shall be so located that the discharge point is outside of buildings, higher than the fill pipe opening, and not less than 12 feet above the adjacent ground level. Vent pipes shall discharge only upward in order to disperse vapors. Vent pipes 2 inches or less in nominal inside diameter shall not be obstructed by devices that will cause excessive back pressure. Vent pipe outlets shall be so located that flammable vapors will not enter building openings, or be trapped under eaves or other obstructions. If the vent pipe is less than 10 feet in length, or greater than 2 inches in nominal inside diameter, the outlet shall be provided with a vacuum and pressure relief device or there shall be an approved flame arrester located in the vent line at the outlet or within the approved distance from the outlet.

16/ It is presumed that complainant would argue that blockage of the vent pipe prevents the vapors from discharging upward. However, complainant's brief skips over the point as to why the standard is specifically applicable.

However, this particular requirement pertains to the manner in which vent pipes are to be located; i.e., in a horizontal position to allow vapors to escape upward. There has been no showing that the location or design of the vent pipe at issue violates the cited standard. The vent pipe was constructed to discharge and disperse vapors in an upward position. There is no dispute over this fact.

The standard also states that "[v]ent pipes 2 inches or less in nominal inside diameter shall not be obstructed by devices that will cause excessive back pressure." Complainant makes no reference to this requirement, and it is assumed that he does not consider it applicable to the facts of this case. In any event, there is no evidence to indicate the inside diameter of the vent pipe and solidified adhesive would hardly qualify as a "device." Since the standard is inapplicable to the facts of this case, the alleged violation is vacated.

Item 4 - Alleged Violation of 29 C.F.R. § 1910.106(b)(3)(v)(b)

The underground tanks in the east yard had 4-inch diameter pipes extending approximately 30 inches above the ground. The pipes were used for manual gauging. At the time of the inspection, at least three of the pipes were uncapped and had manual sticks in them. Complainant alleges that the uncapped vents were in violation of 29 C.F.R. § 1910.106(b)(3)(v)(b),[17/] which requires that openings for manual gauging be provided with a liquid-tight cap or cover.

---

17/ Section 1910.106(b)(3)(v)(b) of 29 C.F.R. states:

> Openings for manual gaging, if independent of the fill pipe, shall be provided with a liquid-tight cap or cover. If inside a building, each such opening shall be protected against liquid overflow and possible vapor release by means of a spring loaded check valve or other approved device.

The photographs introduced as Exhibits 9, 10 and 11 show three uncapped manual gauging pipes. A gauging stick is in each of the pipes. Compliance Officer Zucchero testified that he saw an employee manually gauging one of the tanks during the time he was in the yard (Tr. II, 41-42). A vent cap is depicted on the ground in Exhibit 11 (Tr. I, 94). Exhibit 12 shows other pipes used for manual gauging that have a proper cap on them.

The evidence indicates that three gauging pipes did not have their liquid-tight caps in place during the inspection (Exs. 9-11). In each instance, a manual gauging stick had been inserted into the pipe opening. Since Zucchero observed an employee manually gauging the tank shown in Exhibit 11 (Tr. II, 41-42), there is no dispute over the fact that an employee was in the process of measuring the tanks. The caps had to be removed to manually gauge the tanks. Furthermore, Exhibit 11 shows the cap lying near the pipe. Respondent had acquired liquid-tight caps for all the pipes (Tr. II, 151). Under the circumstances, it is concluded that the liquid-tight caps had been temporarily removed for manually gauging the tanks. There is no evidence to indicate that the caps for the pipes had been permanently missing. The alleged violation is vacated.

Even if the liquid-tight caps had been permanently removed from the pipes prior to the inspection, the evidence is insufficient to establish a violation. The pertinent part of the standard states:

> Openings for manual gaging, <u>if independent of the fill pipe</u>, shall be provided with a liquid-tight cap or cover . . . . (underlining added)

There is no evidence to indicate that the openings were independent of the fill pipes.

Item 5 - <u>Alleged Violation of 29 C.F.R. § 1910.106(d)(6)(iv)</u>

A large number of 55-gallon drums of Class I, II and III liquids were stored in respondent's west yard area. Rows of drums were stored within inches of bails of

wastepaper and cardboard which were also stored in rows. There was also a growth of weeds in the yard area. These conditions are reflected in Exhibits 13 and 14. Complainant submits that these conditions violated the requirements of 29 C.F.R. § 1910.106(d)(6)(iv),[18/] which requires a storage area be "kept free of weeds, debris and other combustible material not necessary to the storage."

Respondent does not dispute the fact that it was not in compliance with the terms of the standard. It argues that the violation was not serious and that no penalty should be assessed. Respondent submits that the "[s]toring of cardboard adjacent to 55-gallon drums of adhesive did not make an accident which could cause death or serious injury any more probable than if the 55-gallon drums had been stored separately." According to respondent, "[t]he baled cardboard was not more likely to ignite than the barrels of adhesive." However, the liquid stored in the drum is protected from sparks by the metal drum. The wastepaper and cardboard would have been much easier to ignite than the liquid in the sealed metal drums. Once the wastepaper and cardboard ignited, the heat from the fire would have presented a real hazard to the liquid in the drums. The violation was serious.

Respondent points out that the yard area was fenced to keep out trespassers and that employees were not permitted to smoke in the storage yard. It is also pointed out that the inspection was conducted in the Spring and that there was little danger of the wastepaper and cardboard igniting from spontaneous combustion. The chance of a fire breaking out in the yard is considered remote. There

---

18/ Section 29 C.F.R. § 1910.106(d)(6)(iv) provides:

> Security. The storage area shall be protected against tampering or trespassers where necessary and shall be kept free of weeds, debris and other combustible material not necessary to the storage.

was only one employee observed in the yard at the time of the inspection. For these reasons, a penalty of $100 is assessed for the violation.

Item 6 - Alleged Violation of 29 C.F.R. § 1910.106(h)(5)

A tank vehicle-loading station was located at the southeast corner of the plant. Flammable materials were transferred into tank trucks at the loading station. The valve in the fill line was manually opened and closed. There was no device on the fill line which would limit the amount of material being pumped into the tank vehicle. Complainant alleges that respondent was in violation of 29 C.F.R. § 1910.106(h)(5),[19/] since the valve used for the final control for filling tank vehicles was not of the self-closing type.

Section 1910.106(h)(5) requires that tank vehicles and tank car-loading and unloading operations "shall comply with appropriate portions of paragraph (f)(3) of this section." Paragraph (f)(3)[20/] requires valves used for the final control for

---

19/ Section 1910.106(h)(5) states as follows:

> Tank vehicle and tank car loading and unloading. Tank vehicle and tank car loading or unloading facilities shall be separated from aboveground tanks, warehouses, other plant buildings, or nearest line of adjoining property which may be built upon by a distance of 25 feet for Class I liquids and 15 feet for Class II and Class III liquids measured from the nearest position of any fill stem. Buildings for pumps or shelters for personnel may be a part of the facility. Operations of the facility shall comply with the appropriate portions of paragraph (f)(3) of this section.

20/ Section 1910.106(f)(3)(iii) of 29 C.F.R. states:

> Valves. Valves used for the final control for filling tank vehicles shall be of the self-closing type and manually held open except where automatic means are provided for shutting off the flow when the vehicle is full or after filling of a preset amount.

filling tank vehicles to be of the self-closing type. The valve in the line being used for final control at the loading station was manually opened and closed. There was nothing to limit the amount of adhesive or other material being pumped to the tank vehicle. The violation has been established.

While respondent does not dispute the fact that a violation existed, it contends the violation should be reduced to a nonserious violation and the proposed penalty eliminated. Complainant argues that there was a likelihood of a spill of flammable liquids which could have resulted in a fire and explosion. It is pointed out there was evidence of previous spills and that tank vehicles were filled at night which made it more difficult to gauge the amount of adhesive in the tank vehicle. However, the use of a self-closing type valve does not guarantee that accidental spills will not occur. Zucchero conceded that spills could occur from the pipe being misdirected by the employee (Tr. II, 50-51).

Zucchero stated that the intent of the standard was to require an employee to be present during filling operations to prevent a tank overflow (Tr. II, 51). There is no evidence that employees left the area while tank vehicles were being filled. The possibility of an overflow would arise only if the operator forgot to close the valve when the tank was filled or left the area unattended during filling operations. There is no evidence that a possible ignition source existed at the vehicle-loading area. The violation was nonserious.

The number of employees exposed to the hazard and the duration of exposure are unknown. A penalty of $50 is assessed for the violation.

Item 7 - Alleged Violation of 29 C.F.R. § 1910.106(h)(8)(iii)

Several uncovered containers filled with combustible solid material and flammable liquids were located in the pit area. The wood and combustible solid

materials had been removed from the pit. The containers located in the south area of the pit area had been in the pit in excess of one week. Those located in the north area of the pit had been in the same condition for approximately three weeks. An open 5-gallon container of flammable liquid was located adjacent to the No. 14 fill pipe in the northwest corner of the mixing room. The container had been open all during the morning of the inspection.

Complainant alleges that the combustible materials and flammable liquids in the containers were in violation of 29 C.F.R. § 1910.106(h)(8)(iii).[21/] Respondent points out that the combustible materials and flammable liquids in the uncovered containers in the pit area had resulted from a cleaning up of a spill in the pit area. In respondent's view, it is unreasonable to cite an employer for a violation of a standard while it is in the process of correcting the condition. The standard requires that combustible waste material and residues be stored in closed metal waste cans and disposed of daily. The evidence indicates that the metal containers in the pit area had been in the same condition from one to three weeks. The materials were not stored in closed waste cans and were not disposed of daily. The violation as to the uncovered containers in the pit area has been established.

The standard applies to combustible waste materials and residues. Respondent states that the wood and rags in the containers were used in cleaning up the spill of Class II and Class III liquids. It argues that complainant has failed to prove that the materials were "waste materials" as that term is used in the standard. Since the wood and rags were used to clean up the spill, respondent

---

21/ Section 1910.106(h)(8)(iii) of 29 C.F.R. states:

> Waste and residues. Combustible waste material and residues in a building or operating area shall be kept to a minimum, stored in closed metal waste cans, and disposed of daily.

contends they were not waste materials. One definition of waste materials would include materials being thrown away by a person or business as worthless or useless to it. The materials in the containers certainly fall within this definition and were correctly categorized as waste materials.

The open 5-gallon metal container of flammable liquid adjacent to the No. 14 fill line in the northwest corner of the mixing room is not covered by 29 C.F.R. § 1910.106(h)(8)(iii), which applies only to waste and residues. A 5-gallon metal container of flammable liquid would not be properly classified as a residue. The alleged violation of 29 C.F.R. § 1910.106(h)(8)(iii), as it applies to the 5-gallon container of liquid, is vacated.

Complainant alleges that the violation was serious. He reasons that a fire could result in severe burns or death to employees. Since there was no evidence to show a possible source of ignition, there is no evidence to show how the materials might have been ignited. Accordingly, the violation is deemed to be nonserious.

The number of employees working in the pit area and the duration of their exposure is unknown. A penalty of $50 is assessed for the violation.

Item 8 - Alleged Violation of 29 C.F.R. § 1910.178(m)(1)

During the inspection, Compliance Officer Zucchero interviewed an employee in front of a workbench at the compressor filling station. While he was conversing with the employee, another employee drove a forklift up in front of them and deposited an empty skid. There was approximately 2 feet between the end of the skid and the workbench. The driver sounded no warning.

Respondent argues that the testimony of Compliance Officer Zucchero should be given absolutely no probative value on this issue. It is pointed out that the citation states that the forklift operator drove up to an empty skid to remove it,

whereas Zucchero testified that the forklift operator was driving up to leave a skid. Any confusion on the facts was cleared up by the testimony of Kirk Temple, the forklift operator involved in the incident. He testified that he made a trip to the compressor filling station area to pick up a skid with a broken board, dropped it off at another location, and returned to the compressor filling station area with a new skid. When he returned with the new skid, the compliance officer noticed him as he approached the bench and later talked to him about the incident (Tr. II, 125-127, 130). The evidence is clear that the particular incident for which respondent was cited occurred when a new skid was placed in front of the workbench.

Complainant alleges that these facts establish a violation of 29 C.F.R. § 1910.178(m)(1)[22/] since the forklift was driven up to an employee standing in front of the bench. Respondent places emphasis on the words "up to" and argues that there is no evidence indicating how close the skid was placed to the group of individuals talking in front of the bench. However, Zucchero testified that there was approximately 2 feet between the skid and the workbench (Tr. I, 116). A photograph of the skid, as it was placed by the operator of the forklift, is reflected in Exhibit 19. The photograph supports the testimony of Zucchero. The standard uses the expression "up to" in lieu of specifying distances. The placing of the skid within 2 feet of the bench while an employee was standing in front of the bench certainly meets the "up to" criteria set forth in the standard.[23/] The violation has been established.

---

22/ Section 1910.178(m)(1) states:

> Truck operations. (1) Trucks shall not be driven up to anyone standing in front of a bench or other fixed object.

23/ The expression "up to" is a colloquial expression having relative meaning depending upon the sense in which the words are used and understood.

Respondent also argues that the violation should be vacated because "it was caused by the OSHA inspection itself." It is correctly pointed out that the employee was in front of the workbench at that particular time because Zucchero chose to interview her at that location. The employee normally works at the end of the workbench, but her duties also require her to be in the area between the workbench and the skids. The workbench is located in a recessed area within the wall. The employee sets up empty cans on the bench and fills them with latex. Once the cans are filled, the employee moves around the table, places lids on the cans and then stacks them on the skids (Tr. II, 127-128). Thus, at any given time her duties could require her to be in front of the workbench.

The interview conducted by Zucchero did not create the hazard. The actions of the forklift operator caused the hazard. Temple testified that he saw the persons in front of the bench (Tr. II, 126-127). Yet, he chose to place the skid while they were in front of the bench.

Respondent submits that the violation, if one occurred, resulted from an "isolated employee mistake." In order to establish this affirmative defense, an employer must prove that the employee's action constituting noncompliance with a standard was a departure from a work rule which the employer had uniformly and effectively enforced and the employer had neither actual nor constructive knowledge of the departure. B-G Maintenance Management, Inc., 76 OSAHRC 60/A2, 4 BNA OSHC 1282, 1976-77 CCH OSHD ¶ 20,744 (No. 4713, 1976). "The defense falls where there is no evidence of work rules, safety instructions, or employee training designed to prevent employee exposure to a cited hazard." Turner Welding & Erection Company, _____ OSAHRC _____, 8 BNA OSHC 1561, 1980 CCH OSHD ¶ 24,553 at 30,035 (No. 16235, 1980).

The evidence in this case fails to establish that the operator had been provided any training in operating a forklift. Temple testified that he had been provided no training but that the driving of a forklift "was more or less just using common sense." (Tr. II, 130) He had been instructed by his supervisor to drive the forklift even though he had no previous training in operating forklifts (Tr. II, 124). In support of its defense, respondent relies on the statement by Temple that it was common sense to not do what he had done (Tr. II, 59-60). However, an employer cannot escape liability under the Act by relying on the judgment of an employee who is inadequately trained in safe work procedures for his assigned job. The employer has a duty to ensure that the employee understands proper safety procedures. Turner Welding & Erection Company, supra. The isolated employee mistake defense is without merit.

Complainant alleges that the violation was serious. The forklift weighed approximately 2 1/2 tons and had a speed between five to ten miles per hour (Tr. II, 129). In the event of an accident where the forklift pinned an employee between it and the bench or ran over an employee, the likely result would have been death or serious injury. The violation was serious.

The incident involved one employee for a short duration of time. The possibility of an accident occurring must be considered remote. A penalty of $150 is assessed for the violation.

Item 9 - Alleged Violation of 29 C.F.R. § 1910.212(a)(1)

The filling room contained three conveyor lines that ran in an east-west direction. Cans that had been previously filled and labeled would be placed on the conveyor lines. A metal lid would be loosely placed on the cans. Each of the lines had a lid compressor unit on it. The unit contained a series of metal rollers

approximately 1 1/2 inches in diameter that became progressively lower until they compressed the lid onto the container. As the cans moved along the conveyor and through the compressor unit, the lids would be sealed on the cans.

The compressor units on the latex and solvent lines were guarded by a heavy steel wire boxlike structure that completely enclosed the unit except for entrance and exit openings. Complainant alleges that respondent violated 29 C.F.R. § 1910.212(a)(1)[24/] because the openings were large enough to permit an employee to accidentally contact the metal pressure rolls. A pinch point was created between the rollers and the lids of the cans. There is no dispute over the fact that the compressor units were guarded. The dispute centers on whether the guards were effective to prevent exposure to injury.

The openings on the guard over the compressor unit on the latex line were approximately 7 inches wide by approximately 9 inches high. The openings were designed large enough to accommodate quart and gallon cans as they moved through the compressor unit (Tr. II, 155). The opening at the entrance was approximately 5 1/2 inches from the first pinch point created by the rollers and the top of the can. The exit opening was approximately 3 inches from the pinch point at the last roll.

An employee was standing several feet from the entrance to the compressor unit. She was placing lids on the top of the cans and then placing the cans on the conveyor so they could travel through the compressor. According to Zucchero, the

---

24/ Section 1910.212(a)(1) of 29 C.F.R. states:

> Machine guarding—(1) Types of guarding. One or more methods of machine guarding shall be provided to protect the operator and other employees in the machine area from hazards such as those created by point of operation, ingoing nip points, rotating parts, flying chips and sparks. Examples of guarding methods are—barrier guards, two-hand tripping devices, electronic safety devices, etc.

employee travelled up and down the line beyond the entrance and exit openings to the compressor unit (Tr. I, 125). Zucchero did not observe the employee place her hand inside the openings in the guard. Paul Bogan, president of the local union, testified that he had observed employees placing their hands through the openings (Tr. II, 112). According to him, employees placed their hands into the entrance and exit openings to manually replace lids that had fallen off or were crooked and needed to be straightened (Tr. II, 112-113). However, there is no evidence to indicate when these incidents allegedly occurred.

Respondent's plant engineer, Jim Minor, testified that the latex line compressor unit was not in operation at the time of the inspection. The company was merely using the conveyor that day to move the cans from the labeler to the point where they went up the elevator (Tr. II, 154-155, 180). Zucchero testified that the line was in operation during the inspection but could not recall if only the conveyor was being used (Tr. II, 61). Even if the compressor unit was not operated at the time of the inspection, there is nothing to indicate that it would not be operated in the future. Moreover, Bogan testified that he had seen the line in operation and had observed employees placing their hands inside the entrance and exit openings (Tr. II, 113).

The solvent filling line was almost identical to the latex filling line. The same type of guard had been constructed over the compressor unit, and the same type of entry and exit openings existed (Tr. I, 127). There is no evidence as to the location of the employee in relation to the compressor unit. However, Bogan testified that he had observed employees placing their hands into the entrance and exit openings (Tr. II, 113).

The Dierks filler line in the mixing room was similar to the latex and solvent filling lines. It had a conveyor and lid compressor unit that was guarded in the

same manner as the latex and solvent compressors. Again, complainant argues that the entrance and exit openings were too large and allowed employees to come in contact with the nip point created by the can and the rollers of the lid compressor. The entrance and exit openings were several inches larger than the cans passing through the unit. The entrance was approximately 9 1/2 inches high and 7 inches wide. The opening at the exit end was approximately 10 inches high and 7 inches wide. The entrance opening was approximately 6 inches from the hazardous components of the compressor. The exit was approximately 2 inches from the hazardous components.

Section 1910.212(a)(1) requires guarding to protect the operator and other employees in the machine area from hazards such as those created by point of operation, rotating parts, flying chips and sparks. The standard does not specify any particular type of guarding method. However, the standard must be interpreted to effectuate and not hinder the statutory purpose of employee protection. The Commission has held that "inasmuch as subsection (a)(1) both introduces and summarizes the import of the entire section 1910.212, it should be construed in light of, and consistently with, the balance of the section." Hughes Brothers, Inc., 78 OSAHRC 65/A2, 6 BNA OSHC 1830 at 1833, 1978 CCH OSHD ¶ 22,909 (No. 12523, 1978). In order to prove a violation, the Secretary must prove that the point of operation, ingoing nip points or rotating parts is unguarded and that the method of operation exposes an employee to injury. Hughes Brothers, Inc., supra.

The pressure points of the lid presses were inside the area covered by the heavy metallic guards. The only openings were for the cans to enter and exit the compressor units. In order for an employee to reach the pressure rolls, he would have to deliberately reach through the openings into the machine. There is nothing

about the normal operation of the latex, solvent and Dierks filling lines that exposes an employee to injury. The employee merely places lids on the cans at a point some distance from the compressor unit. The conveyor moves the cans along the lines and through the compressor units. The employee is not involved in placing the cans in the compressor unit. This is not a "feed" type operation on the part of the employee. The conveyor belt carries the cans through the lid press automatically.

Plant engineer Minor testified that he had never seen employees place their fingers inside the compressor units while they were running. He has observed the compressor units being turned off while cans were inside the units and needed some adjustment (Tr. II, 159). There is no necessity for employees to place their hands inside the compressor units since the cans automatically move through the units by means of conveyors (Tr. II, 160). Each of the metal guards has a sign on the side that cautions employees to not operate the compressor without the guards (Exs. 21, 26-27). In addition, another sign appears on the side of the guard that has the word "Danger" in large white letters with a red background and the warning to "Keep hands clean of moving machinery." (Exs. 21, 26-27) The barrier guards are painted bright yellow and are highly visible.

The heavy metallic guards enclosing the compressor units fully protected employees from accidental contact with the pressure rolls. Since the employee is not involved in a "feed" operation, he is not required to place his hands near the entry or exit openings. Moreover, closing the openings to the size of the individual cans or moving the openings further from the pressure rolls, as suggested by the compliance officer, would still leave an opening through which an employee could place his hands while the compressor unit is running. The alleged violation is vacated.

There is some reference to accidents having occurred during the operation of the latex, solvent and Dierks lines. However, those accidents occurred prior to the heavy metallic guards being installed. Since those guards were installed, no employee has been injured by placing his hands inside the guards (Tr. II, 183).

A Wells horizontal metal cutting band saw was located in the maintenance shop. The unused portion of the saw blade was not guarded. The saw was used on a regular basis. Respondent concedes this violation but states that the penalty should not exceed $50. The violation must be classified as serious since amputation of fingers could easily be the result of any accident.

While the saw was used on a regular basis, the exact amount of its use is unknown. There is no evidence as to whether the saw is operated by one person or several different persons. There is also no evidence as to the skill or experience of the operator or operators. Accordingly, a penalty of $150 is assessed for the violation.

Item 10 - Alleged Violation of 29 C.F.R. § 1910.212(a)(3)(ii)

The "A" and "B" Microway fillers had lid compressors to seal the lids on containers. The lid compressors were guarded by a heavy wire boxlike structure similar to that guarding the latex and solvent line compressor units. The metal guards had entry and exit openings large enough to accommodate 5-gallon containers.

During the operation of the Microway fillers, empty containers are placed on a roller conveyor by an employee and filled with an adhesvie. After the lid is placed on the container, a switch is actuated and the container is automatically fed through the opening of the guard and positioned under the ram of an air-operated press. The ram descends and seals the lid on the container. The ram descends in

approximately 1.3 seconds and applies a force of 90 p.s.i. After the can is sealed, another container is then placed on the conveyor and filled. A lid is placed on the container, and the employee operating the filling unit again trips the switch which causes that particular container to move into the press while the sealed can is pushed out the exit opening in the guard.

Complainant alleges that the operation of the Microway fillers was in violation of 29 C.F.R. § 1910.212(a)(3)(ii)[25/] because the entrance and exit openings of the guard were too large to prevent employee contact with the point of operation of the ram. The standard requires point of operation guarding where the operation of the machine exposes an employee to injury. In order to prove a violation of the standard, the Secretary must prove that the point of operation is unguarded and that the method of operation exposes an employee to injury. Hughes Brothers, Inc., 78 OSAHRC 65/A2, 6 BNA OSHC 1830, 1978 CCH OSHD ¶ 22,909 (No. 12523, 1978). The dispute centers on whether the guards in use were effective in preventing exposure of employees to injury when the ram descends.

Complainant alleges that the large openings in the guards would allow the employee to reach into the point of operation. The openings at both ends of the guards were approximately 17 inches high by 14 inches wide. Zucchero testified that he observed employees reaching through the openings at the exit ends of the guards (Tr. II, 6-7). However, there is no evidence to indicate that employees are required to reach through the barrier guard openings to perform their job.

---

25/ Section 1910.212(a)(3)(ii) of 29 C.F.R. provides:

> The point of operation of machines whose operation exposes an employee to injury, shall be guarded. The guarding device shall be in conformity with any appropriate standards therefor, or, in the absence of applicable specific standards, shall be so designed and constructed as to prevent the operator from having any part of his body in the danger zone during the operating cycle.

The Microway fillers do not involve a "feed" operation on the part of the employees. There is no part of the job function which requires the employee to place his hands through the openings while the machinery is operating. Employees are not required to manually push the containers through the press. The containers are automatically fed into the press and automatically ejected (Tr. II, 160). There is no necessity for an employee to push a container into the press or to pull a container from the press. Employees are not required to have any part of their body in the danger zone during the operating cycle. The alleged violation is vacated.

Item II - Alleged Violation of Section 110-17(b), National Electrical Code, NFPA 70-1971, as Adopted by 29 C.F.R. § 1910.309(a)

Two switches for the operation of fans were mounted on the north wall of the mixing room. They were located approximately 4 feet above the floor. An aisleway was located adjacent to the north wall. The aisleway was used by powered industrial trucks. One of the switches and the wall showed damage from contact with the powered industrial trucks operated along the aisleway. Complainant submits that these conditions constituted a violation of section 110-17(b) of the National Electrical Code, NFPA 70-1971.[26/]

Respondent submits that it was not in violation of section 110-17(b), which requires enclosures or guards wherever "electrical equipment would be exposed to physical damage." The switches protrude out from the wall, and the wall is

---

26/ Section 110-17(b) states:

> In locations where electrical equipment would be exposed to physical damage, enclosures or guards shall be so arranged and of such strength as to prevent such damage.

immediately adjacent to the aisleway. The wall shows evidence that it has been scraped. The damage to the wall resulted from powered industrial trucks striking it (Tr. II, 11). Since the wall has been struck, the switches were certainly exposed to possible physical damage. The violation has been established.

Respondent argues that the facts do not constitute a serious violation of the Act as alleged by the Secretary. Complainant classified the violation as serious because Class I flammable materials were being processed in the room. According to complainant, a spark could cause a fire or explosion. Unfortunately, no facts exist to support such a conclusion. There is no evidence to indicate that the mixing room or any other area of the plant had a flammable atmosphere (Tr. II, 65-66). If a flammable atmosphere did not exist, there would be no catalyst to cause a fire or explosion. The violation was of a nonserious nature. No penalty is assessed for the violation.

Item 12 - Alleged Violation of Section 501-3(b)(1), National Electrical Code, NFPA 70-1971, as Adopted by 29 C.F.R. § 1910.309(a)

Two battery-charging units in the flammable materials warehouse were set up to charge the batteries on forklifts used in the plant. The units were standard Gould battery chargers and did not bear approval for use in Class I locations. The warehouse was a Class I, Division 2 location. The charging units contained make-and-break contacts.

Complainant alleges that the location of the battery chargers in the flammable materials warehouse was in violation of section 501-3(b)(1) of the

National Electrical Code, NFPA 70-1971.[27/] Respondent submits that complainant has failed to sustain his burden of proof on this issue by failing to establish that a Gould battery charger is one of the items required by the standard to be in an enclosure approved for Class I locations.

Compliance Officer Zucchero testified that he cited respondent for a violation of section 501-3(b)(1) because the battery chargers did not bear an approval for use in Class I locations (Tr. II, 18-19). The cited section clearly states that it applies to "meters, instruments and relays." Assuming a battery charger is classified as an instrument, the section still does not automatically apply. There must be a showing that certain other conditions have not been met. Complainant emphasizes the first part of section 501-3(b)(1) which says enclosures approved for Class I locations shall be required but ignores the remainder of the section which qualifies the approved enclosure requirement. The section contains the following qualifying conditions:

> . . . [u]nless general-purpose enclosures are provided, and current-interrupting contacts are (1) immersed in oil, (2) enclosed within a chamber hermetically sealed against the entrance of gases or vapors, or (3) in circuits which under normal conditions do not release sufficient energy to ignite a specific hazardous atmospheric mixture.

---

27/ Section 501-3(b)(1) provides:

> Class I, Division 2. In Class I, Division 2 locations, meters, instruments and relays shall conform to the following:
>
> (1) Contacts. Switches and circuit breakers, and make-and-break contacts of pushbuttons, relays, and alarm bells or horns, shall have enclosures approved for Class I locations, unless general-purpose enclosures are provided, and current-interrupting contacts are (1) immersed in oil, (2) enclosed within a chamber hermetically sealed against the entrance of gases or vapors, or (3) in circuits which under normal conditions do not release sufficient energy to ignite a specific hazardous atmospheric mixture.

Since there is no evidence to indicate that none of the above conditions existed, complainant has failed to sustain his burden of proof. The alleged violation is vacated.

Item 13 - Alleged Violation of Section 501-4(b), National Electrical Code, NFPA 70-1971, as Adopted by 29 C.F.R. § 1910.309(a)

Thin-walled electrical conduit with screw type fittings was used in the permanent wiring that was supplying power to the battery chargers. The conduit was purchased and installed by William Lake, a maintenance mechanic for respondent. He testified that the company told him to order whatever he needed to install the wiring (Tr. II, 122).

Complainant alleges that the use of the thin wall conduit was a violation of section 501-4(b)[28/] of the National Electrical Code, NFPA 70-1971. Respondent does not contest the violation but submits that it should not be classified as a serious violation.

The wiring was located in the flammable materials warehouse. Zucchero testified that he classified the violation as serious because of the possibility of fire and explosion. There is no evidence to indicate that the atmosphere of the

---

28/ Section 501-4(b) provides:

> In Class I, Division 2 locations, threaded rigid metal conduit or Type MI, MC, ALS or SNM cable with approved termination fittings shall be the wiring method employed. Type MI, MC, ALS or SNM cable shall be installed in a manner to avoid tensile stress at the termination fittings. Boxes, fittings and joints need not be explosion-proof except as required by Sections 501-5(b)(1) and (b)(2). Where provision must be made for limited flexibility, as at motor terminals, flexible metal fittings, flexible metal conduit with approved fittings, liquidtight flexible metal conduit with approved fittings, or flexible cord approved for extra-hard usage and provided with approved bushed fittings shall be used. An additional conductor for grounding shall be included in the flexible cord unless other acceptable means of grounding are provided.

warehouse was flammable. Even if a spark or explosion occurred within the conduit, there is nothing to show how it could cause a fire. There is no evidence of any explosive vapors. The violation was nonserious. No penalty is assessed for the violation.

Item 14 - Alleged Violation of Section 501-5(a)(1), National Electrical Code, NFPA 70-1971, as Adopted by 29 C.F.R. § 1910.309(a)

The two switches on the north wall of the mixing room did not have seals in the fittings. The switches had been installed by an outside contractor. Respondent assumed the contractor was correctly doing the job and made no independent check of his work. Complainant alleges the conditions were in violation of section 501-5(a)(1) of the National Electrical Code, NFPA 70-1971.[29/]

Respondent does not contest the violation but submits it should not be classified as a serious violation. For the reasons previously set forth under item 11, which involves the same two switches, the violation is classified as nonserious. No penalty is assessed for the violation.

## FINDINGS OF FACT

1. Respondent is a corporation engaged in the manufacture of adhesives. It maintains an office and place of business at 220 Janney Road, Dayton, Ohio (Para. II, Complaints and Answers).

---

29/ Section 501-5(a)(1) states:

> In Class I, Division 1 locations, seals shall be located as follows:
>
> (1) In each conduit run entering an enclosure for switches, circuit breakers, fuses, relays, resistors or other apparatus which may produce arcs, sparks or high temperatures. Seals shall be placed as close as practicable and in no case more than 18 inches from such enclosures. There shall be no junction box or similar enclosure in the conduit run between the sealing fitting and the apparatus enclosure.

2. In October 1979 the Cincinnati, Ohio, area office for OSHA received a complaint concerning several alleged violations in respondent's plant. An inspection was attempted in November 1979, but the respondent refused to allow an inspection without a warrant. The matter was referred to the Office of the Solicitor, U. S. Department of Labor, for purposes of obtaining a warrant. The warrant was obtained on April 1, 1980 (Tr. II, 132, 134, 136-137).

3. When representatives of respondent denied the compliance officer the right to inspect in November 1979, they also advised him that they wanted to be present at the hearing to determine if a warrant should be issued (Tr. II, 137). The OSHA office did not inform any representatives of respondent that a warrant was being sought (Tr. II, 138).

4. On April 2, 1980, Industrial Hygienist James Sweeney commenced an inspection of respondent's facilities located at 220 Janney Road, Dayton, Ohio (Tr. I, 10, 12; Tr. II, 26). He was accompanied by Compliance Officers James Zucchero and Paula Moore (Tr. II, 57). The inspection concluded on April 7, 1980 (Tr. I, 12, 60; Tr. II, 26).

5. Upon arrival at respondent's facilities, Compliance Officer James Zucchero served a warrant upon George Stockham (Tr. I, 12, 58; Tr. II, 26).

6. Stockham informed Zucchero that he was protesting the inspection because the warrant had been obtained without any representatives of respondent being present, but he allowed the inspection to proceed (Tr. I, 12; Tr. II, 26-27).

7. Respondent employed approximately 500 persons at the time of the inspection (Tr. I, 82).

8. Respondent had previously been inspected on four different occasions (Tr. I, 83).

9. Respondent was using three oil-lubricated compressors at the time of the inspection. The three compressors were hooked in a series. The compressors did not have a high-temperature or carbon monoxide alarm (Tr. I, 13-15, 40-42; Tr. II, 97-98).

10. The compressors were used to supply breathing air to employees while they were inside a confined space to perform repair work (Tr. I, 14). The air from the compressor was not tested for carbon monoxide when it was being used to supply breathing air (Tr. I, 14-15).

11. On March 26, 1980, one week prior to the inspection, the oil-lubricated compressors were used to supply air inside a 3,500-gallon mixing tank while an employee was performing maintenance inside the tank (Tr. I, 15, 25-26, 39-40). The compressors were located approximately 75 feet from the tank (Tr. I, 40-41). The employee was inside the tank for approximately 20 to 25 minutes (Tr. I, 43).

12. Respondent has two maintenance mechanics who perform vessel entries (Tr. I, 17). On the average, two or three vessel entries are performed each year (Tr. I, 17).

13. When employees are inside a vessel, an employee is sometimes but not always stationed near the compressors to keep an eye on the compressors while the employee is inside the tank[30/] (Tr. I, 20-21, 33, 47; Tr. II, 98). Two persons are also generally stationed near the entrance to the vessel while the entry is in progress (Tr. I, 22).

---

30/ Paul Bogan testified that the air compressors are monitored for approximately 30 percent of the vessel entries (Tr. II, 98).

14. Combustible gas meter readings are taken before an entry is made into any vessel (Tr. I, 23-24, 32). There is no periodic testing for carbon monoxide (Tr. I, 42).

15. Respondent no longer uses the compressors to supply breathing air. It now uses bottled breathing air (Tr. II, 147).

DOCKET NO. 80-2860

16. The platform between and adjacent to the No. 14 and No. 15 mixers had two metal containers, one inside the other, lying on their side and protruding over a toeboard (Exs. 1-2; Tr. I, 62-63).

17. The platform was approximately 12 feet above the adjacent pit floor (Tr. I, 64). It was in use on a regular basis by employees (Ex. 2; Tr. I, 64). An employee was noticed underneath the platform on one occasion during the inspection (Ex. 3; Tr. I, 66).

18. A pan and a piece of pipe were protruding over the toeboard at the platform edge adjacent to the No. 3 and No. 4 mixers (Ex. 4; Tr. I, 68-69).

19. The platform was approximately 10 to 12 feet above the lower level and was used on a regular basis (Tr. I, 70). Employees had occasion to go underneath the platform (Tr. I, 71).

20. The aisle adjacent to the northwest corner of the mixing area was obstructed by 5-gallon cans and 55-gallon drums that were being filled. Some of the cans and drums had already been filled (Ex. 5; Tr. I, 71-72). The material had been in the aisle for approximately 3 1/2 hours at the time it was observed by Compliance Officer Zucchero (Tr. II, 82-83).

21. A drainage ditch located at the southwest corner of the mixing area had its covers removed (Ex. 6; Tr. I, 75-77). The uncovered opening was approximately

10 feet in length, 11 inches wide, and approximately 8 inches deep and made of concrete (Tr. I, 75-76). No type of guarding was provided while the ditch was uncovered (Tr. I, 76).

22. The floor around the drainage ditch was uneven. The uneven floor was due to the adhesives that had solidified on the floor adjacent to the ditch (Tr. I, 76).

23. The pit area of the mixing room, which is approximately 50 inches in depth, was located directly behind the uncovered ditch. The pit was made of concrete and was located approximately 15 inches from the edge of the ditch. Employees were working in the area where the uncovered ditch was located (Ex. 6; Tr. I, 77-78; Tr. II, 102).

24. The cover had been removed in order to clean the ditch. The employee assigned to clean the ditch was cleaning in the pit area. He was approximately 75 feet from the uncovered ditch (Tr. I, 81).

25. The east yard area of respondent's facilities contained pipe openings located above ground level. The tanks were located underground (Exs. 7-8; Tr. I, 84-86, 88). The tanks contained adhesives that were of a Class I flammable nature (Tr. I, 88-89). The pipes were for the purpose of venting flammable vapors from the tanks during the filling and withdrawal operations (Tr. I, 87).

26. One of the vent pipes was blocked by solidified adhesive (Ex. 8; Tr. I, 87; Tr. II, 85). Employees were working in the vicinity of the blocked vent pipe (Tr. I, 89-90).

27. The east yard area of respondent's facilities contained 4-inch diameter pipes, which extended approximately 30 inches above the ground, used for manual gauging of tanks which did not have covers in place. The pipes had manual gauging sticks in them (Exs. 9-11; Tr. I, 91-92, 94; Tr. II, 41).

28. The covers prevent flammable vapors from rising out of the tanks when they are being filled or when the substance in the tank is being withdrawn (Tr. I, 95).

29. Some of respondent's pipes used for manual gauging had proper vent caps on them (Ex. 12; Tr. I, 97).

30. Employees were observed manually gauging the tanks in the east yard at the time of the inspection (Tr. 99; Tr. I, 41-42).

31. Class I, II and III liquids in 55-gallon drums were stored in the west yard area of respondent's facility. The liquids were stored next to bails of wastepaper and cardboard. There was also a growth of weeds in the area (Exs. 13-14; Tr. I, 100-101; Tr. II, 43-46, 152-153). The cardboard and wastepaper were stored within inches of the 55-gallon drums (Tr. II, 87).

32. An employee was operating a forklift in the west yard area (Tr. I, 102-103).

33. A tank vehicle-loading station was located at the southeast corner of the plant. Flammable materials were transferred into tank trucks at the loading station. The valve in the fill line was manually opened and closed (Ex. 15; Tr. I, 104-105; Tr. II, 49-50). Employees were not observed using the filling operation (Tr. I, 107). There was no self-closing valve or metering device to limit the amount of material pumped to the tank vehicle to prevent an overflowing of the vehicle (Tr. I, 106; Tr. II, 48-49).

34. Adhesives were observed on the wall and ground area surrounding where the materials were actually placed into tank vehicles (Ex. 15; Tr. I, 105-106).

35. There were two 5-gallon metal containers and one 55-gallon metal containers in the south area of the mixing room pit area filled with materials of a combustible solid and flammable liquid nature that were uncovered or were not

kept in covered containers (Exs. 16-17; Tr. I, 109-110; Tr. II, 52). The 55-gallon metal containers contained wood and combustible solid materials that had been removed from the pit (Exs. 17-18; Tr. I, 110; Tr. II, 52-53).

36. The cans had been in the pit in excess of one week (Tr. I, 110).

37. The north end of the pit area in the mixing room contained one 55-gallon steel container and four cardboard drums which contained combustible solid debris; e.g., timber, paper, rags. The containers were uncovered (Ex. 18; Tr. I, 110-111). The containers had been in the pit in the same condition for approximately three weeks (Tr. I, 111).

38. The materials had been placed in the containers while employees were cleaning up a spill in the pit area (Tr. II, 111-112).

39. An open 5-gallon metal container of a flammable liquid was located adjacent to the No. 14 fill pipe in the northwest corner of the mixing room (Ex. 5; Tr. I, 113-114). The open container had been at the location all during the morning of the inspection (Tr. I, 113).

40. Several employees worked on a regular basis within the particular area where the 5-gallon metal container was located (Tr. I, 114).

41. While Compliance Officer Zucchero was interviewing an employee in front of a workbench at the compressor filling station, another employee drove a forklift up to the compressor filling station for the purpose of placing an empty skid in front of the workbench. Another employee was at the workbench at the time the forklift approached and ended up located between the workbench and the skid (Ex. 19; Tr. I, 115-118, Tr. II, 54, 125-127). There was approximately 2 feet between the end of the skid and the workbench (Tr. I, 116). The workbench was constructed of wood and angle iron (Tr. II, 128).

42. The forklift driver sounded no warning (Tr. I, 116-117). He had no training in the operation of a forklift (Tr. II, 130).

43. The filling room contained three filling lines operated by conveyors. The latex line had a lid compressor unit on it that sealed the lids on previously filled cans by steel pressure rolls as the cans moved through it. The machinery was guarded by a steel wire boxlike structure that contained entry and exit openings (Exs. 21-22; Tr. I, 121-123, 126).

44. The openings in the guard were approximately 7 inches wide and 9 inches high. At the entrance end of the opening, the first pinch point created by the can and the rollers was approximately 5 1/2 inches from the entrance. At the exit, there was a distance of approximately 3 inches to the pinch point created by the rollers and the can (Tr. I, 123-124).

45. The lid compressor unit was composed of a series of metal rolls approximately 1 1/2 inches in diameter that became progressively lower until they compressed the lid onto the container (Tr. I, 123).

46. An employee was standing several feet from the entrance to the lid compressor unit. She was placing lids on the cans and placing them on the conveyor so they could pass through the compressor unit (Ex. 22; Tr. I, 124). The employee moved back and forth in the area of the machine (Tr. I, 125).

47. The conveyor on the latex line was in operation during the inspection, but the compressor was not being operated (Tr. II, 60-61, 154).

48. The solvent filling line was almost identical to the latex filling line. The same type of entry and exit openings existed in the metal guard around the machinery used to press the lid on previously filled cans (Tr. I, 126-127).

49. A horizontal metal cutting band saw located in the maintenance shop had no guarding for the unused portion of the saw blade (Ex. 23; Tr. I, 128). The right

side of the saw had a 2 1/2-inch opening, and the left side had a 1 1/2-inch opening (Tr. I, 128-129).

50. The band saw was used on a regular basis (Tr. I, 133-134).

51. The Dierks filler unit in the mixing room had a compressor unit to seal lids on the cans. The compressor unit was guarded by a boxlike metal structure that had entry and exit openings (Exs. 24-26; Tr. I, 134-135).

52. One-gallon containers, approximately 8 inches high and 7 inches in diameter, were used on the Dierks filler line. Quart cans, approximately 4 inches in diameter and 5 inches high, were also used on the line (Tr. I, 136).

53. The entry and exit openings in the guard on the Dierks filler unit were several inches larger than the cans passing through the unit. The entrance was approximately 9 1/2 inches in height and 7 inches wide. The entrance was approximately 6 inches from the hazardous components of the machinery (Exs. 24-25; Tr. I, 136-137). The opening at the exit end was approximately 10 inches high by 7 inches wide. The exit was approximately 2 inches from the hazardous components (Tr. I, 137).

54. The Dierks line was not operating at the time of the inspection but was a regular part of respondent's operation (Tr. I, 137; Tr. II, 63).

55. A fabricated piece of metal was lying near the compressor unit. The metal piece had been fabricated to use as an additional guard on the machine (Exs. 26-27; Tr. I, 138; Tr. II, 63-64).

56. The "A" and "B" Microway fillers had lid compressor units to seal the lids on containers. The compressors were guarded by a heavy wire boxlike structure that had entry and exit openings (Exs. 29-30; Tr. II, 4-5).

57. Employees removed the cans from the roller conveyor at the exit end of the machinery and carried them a few feet to a skid (Ex. 30; Tr. II, 5, 88-89). On

one occasion an employee reached inside the guard at the exit end to remove the container (Tr. II, 7).

58. Empty containers are placed on a roller conveyor by an employee and filled with an adhesive mixture. A lid is then placed on the container and a switch actuated to feed the container through the entrance opening of the guard. A ram descends while the can is inside the guard and seals the lid on the container (Tr. I, 6). The movement of the containers through the sealing mechanism is automatic. There is no manual shoving or pushing needed on the part of any employees (Tr. II, 64-65, 160).

59. The entry and exit openings in the metal guard were approximately 17 inches high by 14 inches wide (Ex. 30; Tr. I, 6-7).

60. Two switches for fans were mounted on the north wall of the mixing room approximately 4 feet above the floor. An aisleway was located adjacent to the north wall and was used by powered industrial trucks. One of the switches and the wall showed damage from contact with the industrial trucks (Exs. 31-32; Tr. II, 10-12, 65).

61. Class I flammable materials were being processed in the mixing room (Tr. II, 14). There was no evidence that a flammable atmosphere existed in the mixing room or any other area of the plant (Tr. II, 65-66).

62. At least eight employees were working in the mixing room in the general proximity of the north wall (Tr. II, 15).

63. Two battery-charging units in the flammable material warehouse were set up to charge the batteries on forklifts used in the plant. The units were standard Gould battery chargers and did not bear approval for use in Class I locations. The units contained make-and-break contacts (Tr. II, 18-19).

64. There were one or two employees working in the vicinity of the battery chargers (Tr. II, 20).

65. Thin-walled electrical conduit with screw type fittings was used in the permanent wiring that was supplying power to the battery chargers located in the flammable materials warehouse (Ex. 33; Tr. II, 21-23, 121-122).

66. The employee that installed the conduit was told to order what he needed (Tr. II, 122).

67. The two switches located on the north wall of the mixing room did not have seals in the fittings (Tr. II, 15-16).

68. The switches were installed by an electrical contractor, and respondent assumed he knew what he was doing (Tr. II, 71-72, 161).

## CONCLUSIONS OF LAW

1. Respondent, at all times material hereto, was engaged in a business affecting commerce within the meaning of the Act.

2. Respondent, at all times material hereto, was subject to the requirements of the Act and the standards promulgated thereunder. The Commission has jurisdiction of the parties and the subject matter herein.

3. Respondent was in violation of 29 C.F.R. § 1910.134(d)(2)(ii) for using oil-lubricated compressors which did not have a high-temperature or carbon monoxide alarm to supply air to employees while they worked inside vessels. The violation was serious. A penalty of $200 is assessed for the violation.

4. Respondent was in violation of 29 C.F.R. § 1910.22(a)(1) for failure to keep two separate platform areas and an aisle adjacent to the northwest corner of the mixing area in a clean and orderly manner. The violation was nonserious. A penalty of $50 is assessed for the violation.

5. Respondent was in violation of 29 C.F.R. § 1910.23(a)(8)(ii) for failing to protect a drainage ditch, which had its grate removed, by a removable standard railing or to provide constant attention to the ditch by someone to prevent employee exposure to a tripping hazard. The violation was serious. A penalty of $150 is assessed for the violation.

6. Respondent was not in violation of 29 C.F.R. § 1910.106(b)(3)(iv)(a) since the standard is inapplicable to the facts.

7. Respondent was not in violation of 29 C.F.R. § 1910.106(b)(3)(v)(b). The liquid-tight caps or covers had been temporarily removed to gauge the tanks. There is also no evidence to indicate that the openings were independent of the fill pipes.

8. Respondent was in violation of 29 C.F.R. § 1910.106(d)(6)(iv) for failing to keep the storage area free of weeds and other combustible material. The violation was serious. A penalty of $100 is assessed for the violation.

9. Respondent was in violation of 29 C.F.R. § 1910.106(h)(5) for failure to provide a self-closing type valve as the final control in the line at the truck filling operation. The violation was nonserious. A penalty of $50 is assessed for the violation.

10. Respondent was in violation of 29 C.F.R. § 1910.106(h)(8)(iii) for failure to store combustible waste materials in closed metal cans and to dispose of it daily. It was not in violation of the standard for having a 5-gallon container of liquid in the mixing room with its lid removed. The violation was nonserious. A penalty of $50 is assessed for the violation.

11. Respondent was in violation of 29 C.F.R. § 1910.178(m)(1) as a result of a forklift operator driving within 2 feet of an employee while the employee was

standing in front of a bench at the compressor filling station. The violation was serious. A penalty of $150 is assessed for the violation.

12. Respondent was in violation of 29 C.F.R. § 1910.212(a)(1) for failure to safeguard the unused portion of the blade on a horizontal metal band saw located in the maintenance shop. The violation was serious. A penalty of $150 is assessed for the violation.

13. Respondent was not in violation of 29 C.F.R. § 1910.212(a)(1) in regard to the existing guards on the latex and solvent filling lines in the filling room and the Dierks filler unit in the mixing room. The guards adequately protected employees.

14. Respondent was not in violation of 29 C.F.R. § 1910.212(a)(3)(ii) since the existing guard on the "A" and "B" Microway fillers adequately protected employees from any point of operation hazard.

15. Respondent was in violation of section 110-17(b) of the National Electrical Code, NFPA 70-1971, for failure to protect two electrical switches on the north wall of the mixing room from physical damage. The violation was nonserious. No penalty is assessed for the violation.

16. Respondent was not in violation of section 501-3(b)(1) of the National Electrical Code, NFPA 70-1971. Complainant has failed to sustain his burden of proof on the issue.

17. Respondent was in violation of section 501-4(b) of the National Electrical Code, NFPA 70-1971, for using thin-walled electrical conduit on the east wall of the warehouse. The violation was nonserious. No penalty is assessed for the violation.

18. Respondent was in violation of section 501-5(a)(1) of the National Electrical Code, NFPA 70-1971, for failure to have seals in two switches located on the north wall of the mixing room. The violation was nonserious. No penalty is assessed for the violation.

## ORDER

Based upon the findings of fact and conclusions of law, it is

ORDERED: (1) That the serious citation issued to respondent on April 18, 1980 (Docket No. 80-2423), is affirmed and a penalty of $200 assessed for the violation;

(2) That items 3, 4, 10 and 12 of the serious citation issued to respondent on April 23, 1980 (Docket No. 80-2860), and the penalties proposed for the alleged violations, are vacated in their entirety;

(3) That item 7 of the serious citation issued to respondent on April 23, 1980, is vacated as to the open 5-gallon container in the mixing room and is affirmed as a nonserious violation with regard to the remaining allegations;

(4) That item 9 of the serious citation issued to respondent on April 23, 1980, is affirmed insofar as it pertains to the band saw but is vacated as to the remaining allegations;

(5) That items 2, 5 and 8 of the serious citation issued to respondent on April 23, 1980, are affirmed;

(6) That items ., 6, 11, 13 and 14 of the serious citation issued to respondent on April 23, 1980, are modified to affirm the allegations as being of a nonserious nature;

(7) That the following penalties are assessed for the violations determined in Docket No. 80-2860:

| Item No. | Assessed Penalty |
|---|---|
| 1 | $ 50 |
| 2 | $150 |
| 5 | $100 |

| Item No. | Assessed Penalty |
|---|---|
| 6 | $ 50 |
| 7 | $ 50 |
| 8 | $150 |
| 9 | $150 |

(8) That the "other" citation issued to respondent on April 23, 1980, is affirmed.

Dated this 24th day of March, 1981.

DECISION

Before: ROWLAND, Chairman; CLEARY and COTTINE, Commissioners.

BY THE COMMISSION:

These cases concern ex parte warrants obtained by the Secretary of Labor in early 1980 to inspect the workplaces of Smith Steel Casting Company in Marshall, Texas, and Compressor Engineering Corporation in Houston, Texas. The Secretary made the ex parte applications under his regulation at 29 C.F.R. § 1903.4 as amended in December 1978.[1/] The Respondents contend

---

1/ The regulation at issue, 29 C.F.R. § 1903.4, as amended in 1978, provides in pertinent part as follows:

(continued on next page)

that this regulation is invalid and moved that the evidence gathered during the inspections be suppressed. Judge Edwin G. Salyers in Docket Nos. 80-2069 and 80-2322 (Smith Steel Casting Company) and Judge E. Carter Botkin in Docket No. 80-2775 (Compressor Engineering Corporation), upheld the Respondents' contentions, relying on Donovan v. Huffhines Steel Co., 645 F.2d 288 (5th Cir. Unit A, 1981). See also Cerro Metal Products v. Marshall, 620 F.2d 964 (3d Cir. 1980). But see Marshall v. Seaward International, Inc., 644 F.2d 880 (4th Cir. 1981) (table), aff'g 510 F. Supp. 314 (W.D. Va. 1980); Rockford Drop Forge Co. v. Donovan, 672 F.2d 626 (7th Cir. 1982); W & W Steel Co. v.Marshall, 604 F.2d 1322 (10th Cir. 1979). The Secretary's petitions for review in both cases were granted.[2/]

---

1/ (continued)

§ 1903.4 Objection to inspection

(a) Upon a refusal to permit a Compliance Safety and Health Officer, in exercise of his official duties, to enter without delay and at reasonable times any place of employment or any place therein, to inspect, . . . [he] shall endeavor to ascertain the reason for such refusal, and shall immediately report the refusal and the reason therefor to the Area Director. The Area Director shall consult with the Regional Solicitor, who shall take appropriate action, including compulsory process, if necessary.

* * *

(d) For purposes of this section, the term compulsory process shall mean the institution of any appropriate action, including ex parte application for an inspection warrant or its equivalent.

2/ The cases are before the Commission for review pursuant to 29 U.S.C. § 661(i). Commissioner Cottine granted the Secretary's petition in Docket Nos. 80-2069 and 80-2322. Commissioner Cleary granted the Secretary's petition in Docket No. 80-2775. Because the cases present the same issue, the Commission has consolidated them for purposes of review. Commission Rule 9, 29 C.F.R. § 2200.9.

The Commission has held that the Secretary had authority under section 1903.4 as amended in 1978 to obtain ex parte warrants. Roberts Consolidated Industries, Inc., OSHRC Docket Nos. 80-2423 and 80-2860 (June 30, 1982). See also Davis Metal Stamping, Inc., OSHRC Docket No. 78-5775 (June 30, 1982). This Commission precedent controls the disposition of these cases. The Secretary was authorized to obtain the ex parte warrants and the inspections conducted under the warrants were valid. Furthermore, for the reasons set forth in Davis Metal Stamping, Inc., we do not read the opinion in Donovan v. Huffhines Steel Co., supra, to require the Commission to reach a contrary result in the disposition or remedy in this case. We therefore set aside the judges' decisions[3/] and remand the cases to the respective judges for further proceedings consistent with this opinion.[4/] SO ORDERED.

FOR THE COMMISSION

Ray H. Darling, Jr.

RAY H. DARLING, JR.
EXECUTIVE SECRETARY

DATED: JUN 30 1982

---

3/ Chairman Rowland concludes that the Secretary improperly obtained the warrants in these cases and would vacate the Secretary's citations for the reasons stated in his dissenting opinions in Roberts Consolidated Industries and Davis Metal Stamping.

4/ Docket No. 80-2775 (Compressor Engineering Corporation) is hereby severed from Docket Nos. 80-2069 and 80-2322 (Smith Steel Casting Company). Commission Rule 10, 29 C.F.R. § 2200.10.

For the Respondent.

DECISION AND ORDER

BOTKIN, Judge:

As a result of an inspection conducted on April 29, 1980, of respondent's place of business located at 5440 Alder, Houston, Texas, a citation was issued to respondent on May 2, 1980, alleging a serious violation of § 5(a)(2) of the Occupational Safety and Health Act of 1970, 29 U.S.C. 651 et seq. ("the Act"). On August 13, 1980, an order was issued that (i) the Secretary's failure to file a complaint had resulted in a waiver to file that pleading and (ii) the contested action would stand as his allegations in the case. Thereafter, respondent timely filed an answer. Among other defenses, it alleged that the

inspection violated its Fourth Amendment rights as it arose out of an inspection warrant which was issued ex parte. It demanded a hearing, prior to a hearing date on the merits, to determine whether its constitutional rights had been violated. Thereafter, on September 29, 1980, the undersigned issued an order to respondent to show cause why such a hearing was necessary since the issue of the legality of an ex parte warrant appeared to be solely an issue of law. In its response, respondent agreed that the warrant issue was solely an issue of law. However, it felt that oral presentation by the parties of their respective contentions was preferable due to the complexity of the issue. In addition to said hearing, it demanded that the warrant be quashed and the citation be vacated. A ruling was delayed due to the Review Commission decision in the case of Asarco, Inc., El Paso Division, 80 OSAHRC _____, 1980 CCH OSHD ¶ 24,838 (No.79-6850, 1980), which held that the filing of a complaint by the Secretary is mandatory. Therefore, the order, dated August 13, 1980, was vacated and the parties were given an opportunity to submit written statements on whether the action should be dismissed. Ultimately, the Secretary's motion to file a complaint out of time was granted. Respondent timely filed its answer thereto. Once again, it raised the Fourth Amendment defense, renewed its demand for a preliminary hearing, and a order dismissing the complaint and vacating the citation. Thereafter, respondent's request for a preliminary hearing on the constitutional issue was denied. Hearings scheduled on March 4 and April 8, 1981 were cancelled due to the parties' desire to submit the case for decision based on a written stipulation of facts. A stipulation of facts, governing the case, was filed on April 27, 1981. Respondent has also filed proposed conclusions of law and brief in support thereof.

The stipulation of facts reveals that on April 8, 1980, one of the Secretary's compliance officer's appeared at respondent's workplace for a general schedule safety inspection. Officials of respondent informed him that entry to the workplace would not be allowed without a warrant. It further discloses that, on April 23, 1980, an inspection warrant authorizing a general schedule inspection of respondent's workplace was issued by a United States Magistrate without any notification to respondent. On April 29, 1980, a compliance officer presented the inspection warrant to respondent's president. The compliance officer was allowed entry to the respondent's workplace and subsequently conducted a wall to wall inspection. As a result of his inspection findings, a citation was issued to respondent.

In its brief, respondent continues to press its argument that (i) the citation, issued on May 2, 1980, was invalid since it was based on an inspection made pursuant to an ex parte inspection warrant, and (ii) the citation must be vacated and the complaint dismissed. It's proposed conclusions of law are consistent therewith.

In a recent decision, Sarasota Concrete Co., No. 78-5264 (Rev. Comm. April 28, 1981), the Review Commission held the exclusionary rule applicable to OSHA proceedings in the context of a violation of Fourth Amendment rights. Respondent has not filed a motion to suppress the evidence obtained as a result of the inspection in this case. However, it raised a defense in its answer that the citation was invalid since it was based on an inspection made pursuant to an ex parte inspection warrant and it repeatedly demanded a preliminary hearing to determine whether its Fourth Amendment rights had been violated. In essence, respondent's demands amounted to a motion to

supress the evidence obtained as a result of the inspection. The ends of justice would not be served by holding otherwise.

The precise issue presented has not been resolved by the Review Commission. The Circuit Courts of Appeal are divided in their opinions. In Cerro Metal Products v. Marshall, 620 F. 2d 964 (3d.Cir.1980), the Third Circuit held that 29 CFR 1903.4 does not permit and authorize ex parte inspection warrants. In the most recent decision, the Fifth Circuit arrived at the same decision. It affirmed the decision of the District Court without comment. Marshall v. Huffines Steel Company, _____F.2d _____(5th Cir. 1981). The Tenth Circuit,in Marshall v. W and W Steel Company, Inc., 604 F.2d 1322 (10th Cir.1979), held that ex parte warrants issued under said section were valid. In Stoddard Lumber Co., Inc. v. Marshall,627 F.2d 984 (9th Cir.1980), the Ninth Circuit also held that ex parte warrants issued under similar circumstances were valid.

I find the reasoning of the courts in the Cerro and Huffines cases to be persuasive and rely thereon in making this decision. I, therefore, find that the ex parte warrant issued in this case on April 23, 1980 (prior to the amendment of 29 CFR 1903.4 by APA rule making proceedings) was not valid. As a result thereof, the evidence resulting from the inspection conducted on April 29, 1980 must be suppressed. Consequently, I will dismiss the complaint and vacate the citation. Accordingly, I do not reach other arguments related to the validity of the inspection warrant raised by the respondent or the merits of the case.

**ORDER**

The complaint is dismissed and the citation is vacated.

So ORDERED.

E. Carter Botkin

E. CARTER BOTKIN
Administrative Law Judge

# OCCUPATIONAL SAFETY AND HEALTH REVIEW COMMISSION

## NOTICE OF DECISION

Secretary of Labor v. Volk Construction, Inc.
OSHRC Docket No. 81-2669 S

1. Enclosed is a copy of my decision. It will be filed with the Commission on June 1, 1982, and will become the final order of the Commission on July 1, 1982, unless a Member of the Commission directs that it be reviewed.

2. You may petition for discretionary review of this decision by the Commission. A petition may be filed directly with me within twenty (20) days from the mailing of my decision. Thereafter, a petition should be mailed to the Executive Secretary, Attention:

   Chief Review Counsel
   Occupational Safety and Health Review Commission
   1825 K Street, N.W., Suite 601
   Washington, D.C. 20006.

   Any petition filed directly with the Commission will be considered to the extent that time and resources permit. The last day the Commission may consider your petition is July 1, 1982. This final order date is fixed by law and cannot be extended under any circumstances.

3. If review is ordered by a Member of the Commission, each party to this case will be notified. In addition, each party will be given an opportunity to submit a brief to the Commission.

4. Please complete the enclosed postcard indicating whether you presently intend to seek review of this decision and mail the completed card promptly. Your response does not bind you in any way, but it assists the Commission in processing your petition when it is filed.

5. For any further details on the review process, see Commission Rules 90, 91, 92, and 93.

James A. Cronin, Jr.
Judge, OSHRC

Date: May 12, 1982

OCCUPATIONAL SAFETY AND HEALTH REVIEW COMMISSION

| | |
|---|---|
| SECRETARY OF LABOR<br><br>Complainant,<br><br>v.<br><br>VOLK CONSTRUCTION, INC.,<br><br>Respondent | OSHRC DOCKET NO. 81-2669S |

APPEARANCES:

James L. Abrams, Esquire, of Denver, Colorado,
For the Complainant,

Roy D. Volk, President, Volk Construction, Inc.,
of Great Falls, Montana,
For the Respondent.

DECISION AND ORDER

As a result of an inspection on November 19, 1981, by the Occupational Safety and Health Administration (OSHA), the respondent, Volk Construction, Inc. (Volk), was cited by the Secretary of Labor for a violation of 29 C.F.R. §1926.451(c)(6)--failure to erect posts of a tube and coupler scaffold on suitable bases. No penalty was proposed for this citation.

The citation describes the violation as follows:

> "Tube and coupler scaffold posts were not erected on a suitable base:
>
> (a) A sill was not used to support scaffold post on disturbed ground at the south side of the building."

29 C.F.R. §1926.451(c)(6), as promulgated, provides:

> (6) Posts shall be accurately spaced, erected on suitable bases, and maintained plumb.

§1926.452(b)(32) defines "Tube and coupler scaffold" as:

> An assembly consisting of tubing which serves as posts, bearers, braces, ties, and runners, a base supporting the posts, and special couplers which serve to connect the uprights and to join the various members.

Volk's notice of contest, dated December 1, 1981, contended the the violation was "incorrect" because the scaffold was erected and rested upon "compacted in place backfill" not "disturbed ground". Subsequently Volk amended its notice of contest to include the following statement:

> "It was discussed and duly recorded after indepth conversation with our project foreman, on the particular project in question, the OSHA inspector stated the only reason he gave us a citation was to justify he was on our project that particular day."

At the conference/hearing held on April 7, 1982, at Great Falls, Montana, Volk's President, Ray Volk, admitted the violation but continued to question the motive of the OSHA inspector and the Secretary of Labor's policy in issuing the citation (Tr. 24). He further contended that bases on the scaffold's posts were unnecessary on November 19, 1981, because the scaffold's posts were erected on frozen ground. Mr. Volk also filed a post-hearing statement in which he claimed that because the standard's phrase "suitable base" is "very vague, misleading and can have different interpretations," the issuance of the citation was "unwarranted and unjustified."

## Discussion

A de minimis violation, with no penalty, will be affirmed.

Section 9(a) of the Occupational Safety and Health Act of 1970 (29 U.S.C. §651 et seq) authorizes the Secretary of Labor to prescribe procedures for the issuance of a notice in lieu of a citation with

respect to de minimis violations which have no direct or immediate relationship to safety or health. A notice of this type, and not a citation, would have been more appropriate in this case. Unfortunately, the Secretary has never prescribed procedures for the issuance of notices for de minimis violations in lieu of citations.

Volk obviously violated the standard at §1926.451(c)(6), but not for the reasons alleged in the citation. By definition a "tube and coupler scaffold" includes "a base supporting the posts". See §1926.452(b)(32). And §1926.451(c)(6) requires posts to be erected on "suitable bases". Clearly, therefore, the term "bases" relates to those metal bases into which the scaffold posts or legs are customarily inserted and on which the posts rest, and not to the ground, floor, or other types of foundations on which an entire scaffold may rest. (Tr. 15-16; See also §1926.451(d)(4)). Because Volk's scaffold posts were not set on individual bases, a violation of §1926.451(c)(6) was committed. The citation's reference to the absence of a sill, however, is irrelevant. The standard at issue here does not reference or require sills or other foundations for scaffolds. The requirement for sills, in addition to bases, is found at §1926.451(d)(4).

Although Volk failed to comply with the requirements of the cited standard, the record establishes that the violation, when committed, had only a negligible relationship to employee safety. According to the Secretary's compliance officer, the standard's "suitable base" requirement is to prevent the posts from punching into the soil and causing displacement of the scaffold. (Tr. 14, 17-18) At the time of the inspection, however, the compliance officer observed no punching into the ground and he found "no fault" with the soil on which the scaffold rested. (Tr. 20-21)

The scaffold also was only five feet off the ground and rested on frozen ground. (Tr. 31) This evidence supports a finding that the safety of Volk's two employees on the scaffold was not diminished by Volk's failure on November 19, 1981, to have bases for the scaffold's posts. Therefore, the violation is found to be de minimis. See Continental Oil Co., 79 OSAHC 42/C3, 7 BNA OSHC 1432, 1979 CCH OSHD ¶23,626 (No. 13750, 1979).

Although unnecessary to a resolution of this matter, Volk's charge against the compliance officer deserves a brief discussion. Volk originally charged that the compliance officer "stated" at the time of inspection that the only reason he gave Volk a citation was to justify his inspection of the Volk worksite. The record, however, fails to support this charge. Indeed, Mr. Super, Volk's project supervisor, testified and conceded that the compliance officer made no direct statement to the effect that he had to issue a citation in order to justify his inspection of Volk, and admitted that it was simply Mr. Super's personal impression that this was the compliance officer's motive for issuing the citation. (Tr. 32-34) Moreover, there is nothing in this record that reflects adversely on the compliance officer's conduct of the November 19, 1981, inspection.

Finally, an observation--issuance of a citation is not always necessary or appropriate. In this case, a warning and immediate abatement would have been sufficient.

## ORDER

Based upon the entire record, it is ORDERED:

1. A de minimis violation of 29 C.F.R. §1926.451(c)(6) is AFFIRMED, and no penalty assessed.

James A. Cronin, Jr.
Judge, OSHRC

JUDGE'S DECISION JUN 7 '82 RECEIVED

FINAL ORDER ON JUL 7 '82

Appearances:

FOR THE SECRETARY OF LABOR

Francis V. LaRuffa, Regional Solicitor;
Barnett Silverstein, Esq., of Counsel
U. S. Department of Labor
1515 Broadway, Room 3555
New York, New York 10036

FOR THE RESPONDENT

Robert T. Anker, Esq.
295 Madison Avenue
Suite 700
New York, New York 10017

DECISION AND ORDER

ORINGER, JUDGE: This is a proceeding under Section 10(c) of the Occupational Safety and Health Act of 1970, 29 U.S.C. 651 et seq., (hereinafter referred to as "the Act"), to review citations issued by the Secretary of Labor (hereinafter referred to as "Complainant") pursuant to Section 9(a) and a proposed assessement of penalties thereon issued, pursuant to Section 10(a), of the Act.

The Secretary charged the Respondent in Citation 1 with a serious violation of the standard set forth at 29 CFR 1910.95 (b)(3) and proposed a penalty of $720.00 therefor. The Complainant charged the Respondent in Citation No. 2 with a willful violation of the standard set forth at 29 CFR 1910.95(b)(1) and proposed a penalty of $7,200.00 therefor.

The case was originally assigned on October 1, 1981, to Judge Cerbone, who no longer is with this tribunal. On January 5, 1982, the case was re-assigned to the undersigned. On March 23, 1982, a pre-trial conference was held in the case and the Respondent stated that it would attempt certain measures of abatement which would be inspected by the compliance officer. This tribunal gave them one month in which to see whether abatement could and would be accomplished.

On May 4, 1982, a further hearing was held in the instant cause. At the call of the calendar, counsel asked for time to confer.

Thereafter, at 10:11 A.M., the Secretary's representative stated in open tribunal that the parties had worked out an amicable settlement and both parties wanted to read it into the record so that the entire proceeding could be concluded.

The Secretary de facto moved to modify the proposed penalties and the appropriate paragraphs of the complaint so as to reflect a total aggregate proposed penalty of $25.00.

Respondent certified that all violations alleged in the complaint have been abated; that it will comply with the Act in futuro; that it tendered the modified proposed penalty of $25.00 to the Secretary. The compliance officer testified in open court that the abatement was now completed.

Based on these allegations, in open court, of the Secretary's representative as well as the Respondent, the Respondent's motion to withdraw its notice of contest to the citations and the modified proposed penalty, is GRANTED.

Citation No. 1, alleging a serious violation by this Respondent of the standard set forth at 29 CFR 1910.95(b)(3), is AFFIRMED. Citation No. 2, alleging a willful violation of the standard set forth at 29 CFR 1910.95(b)(1), is similarly AFFIRMED. A total aggregate penalty of $25.00 is ASSESSED herein.

SO ORDERED.

# NOTICE OF DECISION

Secretary of Labor v. J. S. Alberici Construction Co., Inc.

OSHRC Docket No. 81-1847

1. Enclosed is a copy of my decision. It will be filed with the Commission on June 8, 1982, and will become the final order of the Commission on July 8, 1982, unless a Member of the Commission directs that it be reviewed.

2. You may petition for discretionary review of this decision by the Commission. A petition may be filed directly with me within twenty (20) days from the mailing of my decision. Thereafter, a petition should be mailed to the Executive Secretary, Attention:

   Chief Review Counsel
   Occupational Safety and Health Review Commission
   1825 K Street, N.W., Suite 601
   Washington, D.C. 20006

   Any petition filed directly with the Commission will be considered to the extent that time and resources permit. The last day the Commission may consider your petition is July 8, 1982. This final order date is fixed by law and cannot be extended under any circumstances.

3. If review is ordered by a Member of the Commission, each party to this case will be notified. In addition, each party will be given an opportunity to submit a brief to the Commission.

4. Please complete the enclosed postcard indicating whether you presently intend to seek review of this decision and mail the completed card promptly. Your response does not bind you in any way, but it assists the Commission in processing your petition when it is filed.

5. For any further details on the review process, see Commission Rules 90, 91, 92, and 93.

JUDGE'S DECISION
JUN 8 '82
RECEIVED

FINAL ORDER ON
JUL 8 '82

APPEARING ON BEHALF OF COMPLAINANT:

KEITHLEY F. T. LAKE, ESQ., U. S. Department of Labor, Office of the Solicitor, 911 Walnut Street, Room 2106, Kansas City, Missouri 64106

APPEARING ON BEHALF OF RESPONDENT:

GREGORY F. HOFFMANN, ESQ., Millar, Schaefer & Hoffmann, 818 Olive Street, Suite 430, St. Louis, Missouri 63101

Hearing held December 1, 1981, St. Louis, Missouri, Judge F. Daley Abels presiding.

## STATEMENT OF THE CASE

Paul E. Dixon, Judge:

Following the hearing in the foregoing matter and prior to the receipt of briefs of the parties, Judge F. Daley Abels became unavailable for Decision, having been affected by reduction in force by this agency and his employment by another agency. The above-styled case was thereupon assigned to the undersigned Administrative Law Judge for Decision.

Upon complete review of the various pleadings, the transcripts, all post-hearing briefs and motions, Judge Abels' trial notes, and discussions with Judge Abels, the following Decision is made.

As a result of a complaint on June 29, 1981, compliance officer Thomas McGrath conducted an inspection of respondent's worksite at the Union Electric Meramec Plant at Oakville, Missouri, where respondent was engaged in construction activities in the area of Fan Unit 1A.

At the construction site, McGrath met with Lyn R. Farley, respondent's project manager, who advised him that a boilermaker had fallen in a sky climber due to a cable parting. The cable had been removed from the jobsite.

The sky climber was a single-point suspension scaffold made by the Hi-Lo Power Scaffolding Company (Exhibit C-1).

A single cable is hung from a structural part of the jobsite and hooked to the equipment, which in turn is driven by a 3/4-inch drill motor which raises and lowers the cage on the cable. The cage provides employees with access to workareas within parts of the structure.

The structure being worked on was determined from the drawings to be 79 feet high.

Exhibit C-2 demonstrates the area where the cable had been tied off for the scaffold.

McGrath, on June 30, 1981, went to the St. Louis Testing Laboratories and viewed and took photographs and measurements of the cable (Exhibit C-3).

McGrath was unable to develop any definite evidence as to where the Hi-Lo was located at the time the cable parted, but as a result of his investigation felt that there had been a violation of 29 CFR 1926.28(a) (personal protective equipment); i.e., safety belt, lifeline, rope grab, which he recommended based on past experience in using scaffolds aboveground.

Thereafter, prior to the matter coming on for hearing, complainant by motion moved to amend the citation and complaint to violation of 29 CFR 1926.451 (k)(8). This motion was granted.

THE STANDARD

"29 CFR 1926.451--Scaffolding
(a) General requirements
(1) Scaffolds shall be erected in accordance with requirements of this section.

***

(i) (Swinging scaffolds) two-point suspension
(8) On suspension scaffolds designed for a working load of 500 pounds, no more than two men shall be permitted to work at one time. On suspension scaffolds with a working load of 750 pounds, no more than three men shall be permitted to work at one time. Each employee shall be protected by an approved safety life belt attached to a lifeline. The lifeline shall be securely attached to substantial members of the structure (not scaffold), or to securely rigged lines, which will safely suspend the employee in case of a fall. In order to keep the lifeline continuously attached, with a minimum of slack, to a fixed structure, the attachment point of the lifeline shall be appropriately changed as the work progresses. [Emphasis supplied]

***

(k) Single-point adjustable suspension scaffolds
(8) Suspension methods shall conform to applicable provisions of paragraphs (h) and (i) of this section." [Emphasis supplied]

## THE EVIDENCE

Through interviews with other employees, the compliance officer determined that no personal protective equipment had been used by the injured employee who was estimated to have fallen between 30 and 38 feet when the cable separated.

McGrath described the lifeline as an independent rope which had a rope grab which attached to the lifeline and to the employee's safety belt, so that if the employee would fall the grab rope would arrest the employee's fall. The lifeline would be attached to a separate structural member apart from the cable used to hoist the Hi-Lo.

McGrath testified that he optioned to cite 29 CFR 1926.28(a) for purposes of clarity, after having originally determined to cite respondent under 29 CFR 1926.451(k)(8).

McGrath felt that the referring back to subsections (h) and (i), which expressly require the use of lifeline and safety belts, was not as clear as section 28(a).

McGrath further determined that the injured employee Stephens was hospitalized and was to undergo major surgery, and based upon this, recommended the issuance of the serious citation, and through the utilization of the complainant's penalty assessment formula determined a proposed penalty in the amount of $420.

Joseph C. Osborne, a boilermaker by trade and ex-employee of respondent, was on the jobsite at the time of the occurrence.

At the time he was helping run a cable out of the sky climber preparatory to he and Stephens going up to rig lugs to weld.

He described the sky climber as a tubular cage with 5/16-inch cable to carry the employees up and down to build scaffolds.

The power was supplied by a drill motor.

Both Osborne and a co-employee were pulling cable to check for bad spots.

A hang line had been dropped to pull the cable for securing, and it was Osborne's estimate that the cable was tied off at the 79 to 80-foot elevation.

Osborne was experienced in the use of the sky buggy and described it's operation, noting that when the buggy was rigged, the employees would tie off to the buggy and after arriving at the elevation they would tie the safety line to the buggy itself; or alternatively, they would let the safety line hang loose until they got to the point to perform work and then tie the buggy.

Osborne has used a grab rope in his work experience, but not on the job in question.

The day of the occurrence was the first day of use of the sky buggy. Osborne was working on the still preparing to weld when the cable broke. He did not see the occurrence.

Osborne rode the elevator down and observed the injured employee Stephens to be in pain and complaining of pain. Osborne did not see that Stephens was wearing a lifeline or a rope grab.

There was a lifeline available for the use of the employees, but the practice at the jobsite was to tie the lifeline to the hoisting unit itself.

James Williamson, a boilermaker at the worksite on the day of the occurrence, identified complainant's Exhibit C-1 as the sky buggy in use at the time, and expressed his familiarity with its operation and observation of it in use on June 20, 1981.

He described that after the buggy's fall the remaining cable hung in the air with a piece of rope hanging next to it, which he assumed to be a

lifeline or safety line, although he did not know how it was used.

He described the usual practice of having a lifeline on the buggy, and after the buggy gets into position utilizing the lifeline to tie the buggy off.

He assumed the rope he saw was the rope used as a tie-off for the buggy.

Williamson described the use of lifelines on other situations, describing that a cable and buggy is rigged up to go to the worksite and a lifeline dropped. A wrap is usually taken on the buggy, and as the buggy goes up the rope is wrapped around a piece of metal on the buggy, so that in the event of a fall the rope would slow the descent and the employee could grab the rope to stop the fall.

At the work position, Williamson noted that should a welder accidentally cut the cable, the rope tying off the buggy would hold the buggy, although he felt that a better method was described in a brochure in the utilization of a rope grab.

Williamson described a rope grab as an item that slides up a 7/8 or 3/4-inch rope and is attached to the safety belt of the employee, not to the buggy, so that if the buggy fell the man would be hanging by the rope.

The operator would have nothing to do, as the rope grab would stop him from falling.

Williamson described the rope grab as being a little more difficult to operate with, in that it has to be adjusted as the buggy rises, but in his opinion was a safer work practice.

Williamson accompanied Stephens to the hospital, where he was advised by the physician that Stephens had a broken pelvis, a broken hip, some vertebra in his back and injuries to his hand and leg.

To the best of Williamson's knowledge, Stephens was not wearing a safety belt or a rope grab, noting that rope grabs were not provided on the particular jobsite.

Williamson was the union steward on the jobsite and was involved with safety meetings with respondent every Monday morning. The meetings are held weekly and Williamson did not mention rope grabs to the company until after the accident, when Williamson urged the company not to use buggies until rope grabs were provided.

Williamson did not recall the exact tie-off point, but estimated that Stephens fell approximately 35 to 40 feet.

Frederick C. Laird, boilermaker for respondent in June of 1981, testified that he had used the sky bucket according to need, sometimes on a daily basis.

Laird used a lifeline in the operation of the buggy, which he described as usually tied to the beam at the highest point and run down through the buggy more or less free of the buggy, with a half-hitch around some portion of the buggy so that the buggy could go up freely.

As the buggy rises, the lifeline hangs free. Laird described wearing a safety belt at times and at other times not wearing a safety belt.

A rope grab was not provided for use with the safety belt.

Laird used the safety belt, so that if he would have to change cables or walk the iron or maneuver on narrow beams he would tie off the beams so he could do his work.

The safety belt was used for work outside of the buggy.

Laird knew the function of a rope grab, and has used them in his past work experience, but testified that no rope grabs were provided by respondent

prior to June 29, 1981.

He was told that there were no rope grabs.

Laird knew the injured employee Stephens was working below him at the time of the occurrence, and to his knowledge Stephens was not using a rope grab on the day of the occurrence, nor was a safety line attached to him.

Compliance officer Joseph Enright, with a Master in Industrial Safety, Bachelor of Science in Trade and Industrial Education to teach safety and fire protection from Oklahoma State University, and Associate Degree in Fire Protection, Oklahoma State University, and attached to the St. Louis area office of OSHA, testified on behalf of complainant.

Enright has been involved in 200 to 250 investigations of construction activity over the course of a six and-a-half year period, and he usually runs across sky buggies on the majority of the inspections, noting that individual contractors use either a single-point suspension scaffold or a two-point suspension scaffold, with about maybe 60 or 70 percent of them using the single-point suspension.

During the course of his investigations, Enright investigates the operation practices involving the single-point suspension scaffolds, and was familiar with the scaffolds demonstrated by complainant's Exhibit C-1.

In Enright's opinion the use of the particular single-point scaffold requires the use of lifeline and other safety related equipment, such as safety belt and the grab hook.

He described that when the employee is standing in the basket, the lifeline is tied off separately from the basket and from the connection where the basket is attached.

The lifeline hangs over away from the center point scaffold.

The employee attaches his grab hook onto the lifeline to his safety belt.

Should the employee fall off of the basket or the basket separate from the employee the employee does not follow the basket down.

In describing the operation of the safety equipment, Enright noted that with one hand the employee would hold onto the control to operate it to go either up or down, and with the other hand he would reach over, grab onto the grab hook, hold it as he would go up, raising the grab hook as he raises the basket or perform the reverse if the basket is descending.

Should the basket fall, the employee would not go any further than the length from the grab hook to the safety belt, and would remain suspended.

With the grab hook about shoulder height as he is being elevated, he would not go more than 3 feet.

It was Enright's opinion that if the lifeline is used to tie off the sky buggy, it does not serve its function as a lifeline and is not an acceptable safety practice, but is no more than a line securing the basket to the work position; nor would it protect the employee if he should fall from the basket.

It is Enright's practice to issue citations for lack of safety belt, grab rope and lifelines under 29 CFR 1926.451(k)(8), and its subparagraphs (h) and (i).

Enright had never operated a sky buggy similar to the one in use by respondent, and was of the opinion that the operator would have to stand either beneath or adjacent to the overhead bar.

Enright described the lifeline as being usually a manila rope 3/8-inch thick or the equivalent with the same strength, and that the use of safety belt, rope grab and lifeline is the recommended safety practice, and has found

that the use of the equipment runs about 50-50 in the construction industry.

Lyn Farley, respondent's project manager with a Bachelor of Science in Civil Engineering and a licensed professional engineer in the State of Missouri, testified on behalf of respondent.

Respondent, at the time of the occurrence, was engaged in installing additional precipitators for union Electric at the power plant, and in the process of tying in the new facility into an old facility and was in the process of finishing up the project.

Farley expressed familiarity with the single-point suspension basket in use at the time, identifying it as a Hi-Lo basket and describing the various views of the basket as represented by respondent's Exhibits R-1 through R-8.

He described the operator as standing under a bale facing a drill motor with the size of the basket being 3 1/2 feet high.

The basket is hoisted by the use of a 5/8-inch drill chuck, which attaches to a shaft to the gear box, the drill driving the drill box, which in turn operates a cable which is looped within the box and goes out the bottom, with the basket hanging plumb and activated by the operator squeezing the drill trigger.

The operator also holds a manual catch in an up position as he squeezes the drill trigger with his other hand, and in Farley's opinion could not fall out by virtue of holding onto the equipment.

Prior to the accident, it was respondent's practice to hang 3/4 to 1-inch manila lifeline adjacent to the cable, through the buggy with a half-hitch on the buggy frame.

It was Farley's opinion that if a man was tied off to a lifeline and was operating the buggy with both hands and the cable would separate, the

bale would come directly down on the operator or adjacent to his neck and shoulder area while the man would be handling his lifeline. Farley was of the opinion that the buggy would not peel away from the employee enough so as to not hurt him seriously by either breaking his neck or rib cage.

Respondent obtained 5/8-inch poly probe rope grabs after the visit from the compliance officer.

Farley opined respondent's election to use its described method of lifeline attachment as opposed to rope grabs on the basis that an employee would be trapped in the buggy with the weight of the buggy holding onto him, and felt that its system was as safe as the lifeline system provided that slack is out of the rope.

Farley was of the opinion that the basket weighed in the neighborhood of 300 pounds, so that with the weight of the employee it would make a total of approximately 500 pounds.

At the time of the occurrence respondent was utilizing a 1-inch manila rope which was attached to the basket, with Farley's opinion that if the safety line remained taut and the cable broke the basket would only fall a couple of feet and while it would not be hanging plumb the manila rope would hold the basket and man until they could be retrieved.

When the cable broke at the time of the occurrence, the safety line was not attached.

It was Farley's opinion that if the safety line was not taut and had slack in it, that the weight of the buggy and the operator would be significant enough to break the manila rope.

Farley was also of the opinion that if a rope grab had been utilized it would have broken the operator's neck.

Farley was referred to the Safety, Operating, Maintenance and Parts Manual, which was in the possession of Farley and respondent as a user of Hi-Lo equipment (Exhibit C-4), and had his attention directed to the second page of the exibit wherein it states that it is unsafe to operate this equipment without the use of fall protection equipment being worn at all times, and has in parenthesis "safety belts, rope grabs and lifelines".

Farley, in response to a series of questions about the recommended safety practices of the Hi-Lo Manufacturing Company, responded with a series of evasive and unresponsive answers, although he did concede that the use of a rope grab would not impede the operation of the unit but merely slow it down.

## ADDENDUM

It will be noted that the language of the craftsmen differs with respect to the protective equipment; i.e., lanyard-lifeline; safety line-lifeline; basket, bucket-sky buggy; grab hook, rope grab-grab rope.

## DISCUSSION

The evidence is undisputed that respondent, in its operations at the Union Electric Power Plant utilized a Hi-Lo one-point suspension scaffold, which was suspended from a cable without benefit of the utilization of lifeline, grab rope or safety belt by its employee.

Respondent, in its brief, raises three basic issues in defense of its position; namely, that the standard at 29 CFR 1926.451(k) deals solely with the hanging of the scaffold itself and does not provide provisions for the protection of the employee; that respondent's practice was in accordance with the general industry practice; and, that the use of the lifeline as required by 29 CFR 1926.451(k) would diminish the employee's safety.

Respondent's argument as to the interpretation of the standard is without

merit and is rejected. The standard specifies divisible requirements, among which each employee must be protected by a safety belt. (See Secretary v. A. C. Gonzalez Painting Contractors, Inc., Docket 4319, 76 OSHRC 47/D9, 4 BNA OSHC 1143, CCH OSHD ¶17,778, 20,622, April 14, 1976 (majority decision))

So too, with respondent's contention that use of a lifeline as required by this standard would diminish the employee's safety. The attachment of the lifeline to a part of the scaffold clearly does not comport with the requirements of the standard. (See Secretary v. Mel Jarvis Construction Company, Inc., Docket 77-2100, 81 OSHRC 89/B13, 10 BNA OSHC 1052, CCH OSHD ¶25,713, September 30, 1981):

> "By prohibiting the attachment of lifelines to any part of the platform or its supporting structure, the standard creates a dual protective purpose: to protect employees from falling from the platform and to protect employees from falling with the platform and its supporting structures should the entire system fail."

Respondent's selection of the alternative means of attachment of the lifeline to the scaffold is demonstrated by the unfortunate facts of this case to be a proven failure.

So too, its argument that the requirements of the statute were prohibited by the respondent's use of two hands in the operation of the scaffold. Even the questionable testimony of respondent's own representative Farley demonstrates that under respondent's practice it was necessary for the employee to adjust the slack of the lifeline within the scaffold as the scaffold is raised or lowered, which is no different than the requirement of the employee to adjust the grab rope as the platform raises or lowers.

Respondent's reliance upon "industry practice" is incorrectly placed. Respondent was in violation of a specific standard and not a general standard.

The fact that the compliance officer testified that 50 percent of industry utilizes the statutory method of personal protective device and 50 percent did not, merely demonstrated that 50 percent of the industry is out of compliance with a specific standard.

The fallacy of respondent's argument is clearly shown in the language of the Seventh Circuit (Faultless Division, Bliss & Laughlin Industries, Inc., a Corp. v. Secretary of Labor and OSHRC, Docket 81-1740, __F.2d__ (7th Cir., 1982), Pg. 17):

> "...Faultless' argument for reliance on industry practice would permit employees to avoid compliance with specific safety mandates by relying on the (perhaps equally objectionable) practices of their peers. Cf. Voegele Co. v. OSHRC, 625 F.2d 1075, 1078-79 (3rd Cir., 1980) (even those courts that consider industry custom and practice do not ignore reasonable person test because to do so would allow entire industries to avoid liability for unsafe conditions). Nothing in the OSH Act or its legislative history requires or permits the Secretary to await an industry consensus about unsafe conditions before moving to enforce. See Bristol Steel & Iron Works, Inc. v. OSHRC, 601 F.2d 717 (4th Cir., 1979)"

Respondent clearly knew of the warning of the manufacturer that closely parallels the mandate of the standard and elected to employ another system which was not protective to the employee. Respondent was in serious violation of 29 CFR 1926.451(k)(8).

The gravity of the violation was severe. The proposed penalty of the complainant is appropriate and should be affirmed.

A careful and considerate evaluation of the record herein, and the applicable law, leads to the following findings of fact and conclusions of law.

## FINDINGS OF FACT

1. Respondent, J. S. Alberici Construction Co., Inc., is a corporation with a principal office and place of business at 2150 Kienlen Avenue, St. Louis, Missouri.

2. At all times relevant to this proceeding, respondent maintained a workplace at Union Electric Meramec Plant, Oakville, Missouri, where it was engaged in construction.

3. Respondent utilizes goods, equipment and materials from outside the State of Missouri and is engaged in a business affecting commerce.

4. Respondent employed approximately 150 employees at the aforesaid workplace at the Union Electric Meramec Plant in Oakville, Missouri, and is an employer within the meaning of the Act.

5. As a result of an inspection by an authorized representative of the complainant on or about June 29, 1981, respondent was issued a citation for serious violation together with a proposed penalty of $420 pursuant to section 9(a) of the Act.

6. Respondent received the citation and proposed penalty on July 17, 1981. On July 22, 1981, respondent notified the Area Director of the Occupational Safety and Health Administration, St. Louis Area Office, of its intent to contest said citation and penalty pursuant to section 10(c) of the Act.

7. On or about June 23, 1981, respondent's employees were working on Unit 1A fan housing using a single-point Hi-Lo power scaffolding, Model DA-100.

8. The Hi-Lo scaffold works off a single steel cable. The cable is hung from a structural point on the structure and hooked to the Hi-Lo scaffold's gear box which is operated by a 3/4-inch drill motor which causes the scaffold to be raised or lowered.

9. On June 23, 1981, William Stephens was using said Hi-Lo scaffold, where

it was tied off by means of a cable to the top of Unit 1A fan housing approximately 79 feet above the ground.

10. The single steel cable used to tie off the Hi-Lo scaffold separated, causing the scaffold to fall to the ground approximately 30-40 feet, seriously injuring Stephens.

11. Stephens was not wearing any lifeline, safety belt or rope grab at the time of the occurrence.

12. The manufacturer's instructions for the use of the Hi-Lo scaffolding provided for the use of lifeline, safety belt and rope grab while operating the scaffold.

13. Respondent was aware of the manufacturer's instructions concerning the fall protection.

14. The lifeline is tied off independent from the basket, and the operator attaches his rope grab to the lifeline and to his safety belt.

15. The protection is so designed so that if the operator falls out of the scaffold or if the scaffold separates from the employee it will prevent the operator from falling.

16. Respondent utilized a security line tie-off, which was in contravention and in violation of the standard and contrary to the express directions of the manufacturer of the scaffold.

## CONCLUSIONS OF LAW

1. Jurisdiction of this matter is conferred upon the Occupational Safety and Health Review Commission under section 10(c) of the Act.

2. Respondent, J. S. Alberici Construction Co., Inc., is an employer within the meaning of the Act.

3. Respondent is engaged in a business affecting commerce.

4. On or about June 23, 1981, respondent permitted one of its employees to operate a Hi-Lo power scaffold in violation of section 5(a) of the Act and the regulations promulgated under the Act, specifically 29 CFR 1926.451(k)(8), by permitting its employee to operate the Hi-Lo scaffold without proper suspension methods; to wit, approved safety life belt attached to the lifeline securely attached to a substantial member of the structure.

5. Respondent knew employees were not using a lifeline, safety belt and rope grab in the operation of the Hi-Lo scaffold.

6. Employees in the operation of the Hi-Lo scaffold without lifelines, life belts and grab ropes were exposed to serious injury.

DECISON AND ORDER

It is hereby ORDERED that amended citation 1 for serious violation of 29 CFR 1926.451(k)(8) and the proposed penalty of $420 are affirmed.

DATE: June 8, 1982

Paul E. Dixon, Judge, OSHRC

   Occupational Safety and Health Review Commission
   1825 K Street, N.W., Suite 601
   Washington, D.C. 20006.

   Any petition filed directly with the Commission will be considered to the extent that time and resources permit. The last day the Commission may consider your petition is July 12, 1982. This final order date is fixed by law and cannot be extended under any circumstances.

3. If review is ordered by a Member of the Commission, each party to this case will be notified. In addition, each party will be given an opportunity to submit a brief to the Commission.

4. Please complete the enclosed postcard indicating whether you presently intend to seek review of this decision and mail the completed card promptly. Your response does not bind you in any way, but it assists the Commission in processing your petition when it is filed.

5. For any further details on the review process, see Commission Rules 90, 91, 92, and 93.

APPEARANCES:

For the Complainant:
Jerry R. Atencio, Esquire, Denver, Colorado
Donald R. McCoy, Esquire, Denver, Colorado

For the Respondent:
Alice McCann Osburn, Esquire, Detroit, Michigan

For the Affected Employees:
Jerry L. Jackson, Northglenn, Colorado
Charles A. Harrison, Northglenn, Colorado

## DECISION AND ORDER

Child, R. M., Judge, OSHRC:

### Statement of the Case

This matter is before the Occupational Safety and Health Review Commission (the Commission) pursuant to section 10(c) of the Occupational Safety and Health Act of 1970, 29 U.S.C. §651 et seq., (the Act). Complainant seeks affirmance of item 1 of Citation No. 1, issued to respondent September 23, 1981,[1/] and of the penalty proposed therefor.

---

1/ A description of the alleged violation and the standards involved:

CITATION

29 CFR 1904.2(a): A log of all recordable occupational injuries and illnesses, (OSHA Form No. 200 or Equivalent), was not maintained at the establishment: e.g., the log for illness and

The Citation charged the violation to be other than serious and proposed a penalty in the sum of $100.00. After the timely filing of a notice of contest by the respondent, the complainant in due course filed Complaint wherein he sought to amend the Citation to characterize the violation to be willful and proposed a penalty of $1,000.00. In its answer respondent challenged complainant's right to so amend the Citation.

The matter came on for hearing before the undersigned judge at Denver, Colorado on February 24, 25, and 26, 1982. Affected employees were represented at said hearing by Jerry L. Jackson, Chairman of the Shop Committee, Local Union 431, United Auto Workers, and Charles A. Harrison, President of said Local Union.

The parties have filed post-hearing briefs and the respondent has included proposed Findings of Fact and Conclusions of Law. To the extent said proposed Findings and Conclusions are consistent with this decision they are adopted; to the extent they are inconsistent with those set forth herein, they are rejected.

---

1/ Continued

injuries (OSHA-200) for year 1980 did not include the following lost workday injuries:

(a) 01/24/80, Milton Gaddis, 1 day lost;
(b) 02/05/80, Robert Mack, 3 days lost;
(c) 06/24/80, Don Pettera, 28 days lost (shown as restricted work activity on General Motor's OSHA-200 log;
(d) 09/08/80, Homer Harris, 4 days lost;
(e) 10/16/80, Robert Ponikiski, 6 days lost;
(f) 10/17/80, Corlis Waits, 4 days lost;
(g) 10/23/80, George Marshall, 2 days lost.

STANDARD

§1904.2 Log and summary of occupational injuries and illnesses.

(a) Each employer shall, except as provided in paragraph (b) of this section, (1) maintain in each establishment a log and summary of all recordable occupational injuries and illnesses for that establishment; and (2) enter each recordable injury and illness on the log and summary as early as practicable but no later than 6 working days after receiving information that a recordable injury or illness has occurred. For this purpose form OSHA No. 200 or an equivalent which is as readable and comprehensible to a person not familiar with it shall be used. The log and summary shall be completed in the detail provided in the form and instructions on form OSHA No. 200.

With the exception of respondent's challenge to complainant's attempt to amend the Citation (which challenge was raised at the hearing and though ruled upon (Tr. 25, 26) is raised again in respondent's post-hearing submission), complainant made no reference and offered no testimony at the hearing or in its post-hearing submittals with regard to miscellaneous affirmative defenses set forth in its answer. With the exception of the challenge to complainant's attempt to amend the Citation, the affirmative defenses set forth in respondent's answer are presumed to have been waived. Issues:

The issues to be determined are:

1. Will the amendment of the Citation to "willful" and the proposed penalty to $1,000.00 be permitted to stand?

2. Was the respondent in violation of the standard at 29 C.F.R. §1904.2(a) as alleged in the Citation?

3. What would be the proper characterization of such violation if any?

4. What penalty, if any, would be appropriate?

## The Evidence

Respondent operates an auto parts warehousing and distribution facility in Denver, Colorado. Jerry L. Jackson, an employee at that facility, was Chairman of the Shop Committee of United Auto Workers Local 431. As such, Mr. Jackson was furnished a copy of Occupational Safety and Health Administration (OSHA) form Number 200 (OSHA-200) at about the time it was prepared for posting each year. As prepared by the respondent soon after the first of each year, said form purported to show the recordable job related accidents and illnesses for the preceding year and related information.

The form dated January 2, 1979, and prepared by respondent was objected to by Mr. Jackson. That OSHA-200 showed only two injuries and no lost workdays in 1978. (Tr. 42; Exhibit E-1) As a result of Mr. Jackson's objection, the general foreman of the facility contacted Dr. Cash, respondent's divisional medical director, in Flint, Michigan. An amended OSHA-200 dated February 23, 1979, was furnished to Mr. Jackson and posted by the respondent, which showed eleven recordable job related injuries, fourteen lost workdays and four days of restricted work activity in 1978. (Tr. 45; Exhibit E-2)

In early 1981 Mr. Jackson was furnished with a copy of the respondent's OSHA-200 which showed no lost time accidents at the facility in 1980. Mr. Jackson protested to Al Green, respondent's general superintendent at the facility. A few days later Mr. Green advised Mr. Jackson that the matter had been discussed with Dr. Cash who said the records were correct and would not be changed.

OSHA-200 dated January 22, 1981, was received in evidence and bears caption "Revised - Annual" for calendar year 1980. (Tr. 67, Exhibit C-1)

On January 23, 1981, Mr. Jackson filed employee grievance No. 739003 protesting ". . . management's falsification of 1980 OSHA annual summary." (Tr. 46; Exhibit R-12) The protest and demand for correction were denied at the local level and appealed to higher level. While that appeal was pending, Mr. Jackson registered a complaint with OSHA and thereafter on May 20, 1981, the grievance procedure was terminated with both sides agreeing to be guided by the final disposition of the pending or anticipated OSHA review. (Tr. 46)

In the course of processing the grievance, Mr. Jackson was told by Al Green that every accident reported at the Denver facility was relayed to Dr. Cash, who in turn determined whether it would be recordable or not. (Tr. 50)

In the summer of 1981 Mr. Jackson discussed OSHA-200 for the year 1980 with Dr. Cash at Reno, Nevada. He gave Dr. Cash names of employees whom he felt had been injured and some examples of injuries and time lost. (Tr. 51, 52) Dr. Cash's response was to question the credibility of the employee reporting the alleged injury and to suggest the injured person may still have been able to do light duty work. Mr. Jackson advised Dr. Cash that the employees he was talking about were not offered light duty. (Tr. 52, 53)

The local union agreement provides that Mr. Jackson as Chairman of the Shop Committee would be notified if any employee were given light duty work. This notice would be given shortly after the employee was assigned to light duty. To his knowledge, D. Pettera was never offered light duty work. (Tr. 53) Mr. Pettera was shown on respondent's OSHA-200 for 1980 as having 28 days of restricted work activity. (Exhibit C-1)

Peggy Schaffler, OSHA Compliance Safety and Health Officer, conducted an inspection at respondent's facility commencing May 18, 1981. She reviewed the OSHA-200 log (Exhibit C-1) and was furnished W Workmen's Compensation forms for 1980. She was informed that Dr. Cash, respondent's Division Medical Director in Flint, Michigan, would make the decision whether an accident should be recorded on the OSHA-200. (Tr. 293-295) Ms. Schaffler was later furnished by respondent with copies of employee medical passes and copies of General Motors accident report form GM212. She also discussed the situation via telephone with Dr. Cash and interviewed various employees. (Tr. 303)

Dr. Cash did not appear as a witness. However, his superior in the hierarchy of respondent, Dr. Richard W. Prior, did testify that in all but one of the instances set forth in the citation he agreed with Dr. Cash that the incidents were nonrecordable. Dr. Prior presents excellent credentials. (Tr. 211-216) He is responsible for supervising, development and implementation of corporate programs and policies. This includes consulting with respondent's various plants on government regulations, including the recordability of occupational injuries and illnesses. (Tr. 217) As an administrator concerned with health and safety of employees he attempts to direct attention to those areas in the plants where the biggest problems with regard to injuries and illnesses exist. Both over-recording and under-recording hinder this task. (Tr. 220, 284) In his judgment the employer would in no way benefit by failing to report all injuries or illnesses with the possible exception of avoiding an OSHA inspection. (Tr. 284) In answering a question from the bench whether his work of visiting plants and of determining problem areas might not be frustrated by selective recording by someone who had already screened out according to what he thought to be recordable, thus depriving him of the whole picture, Dr. Prior answered:

> A. Except I also look at the tally sheets for the medical departments too.
>
> * * *
>
> A. It's a running log of the number of people that whould come in, the type of treatment that you would give.
>
> * * *
>
> A. . . . if we had 40 fractures on the tally sheet and none on the recordability, I'd ask questions. (Tr. 285, see also Tr. 273).

Dr. Prior testified that neither the OSHA-200 form nor the standard covers every conceivable occurrence in a plant. He therefore takes a look at all of the facts available. He looks at the incident, the diagnosis, how the diagnosis was reached--does it make medical sense to him, the time sequence, the credibility, were restrictions preventative or really therapeutic. Having looked at the whole picture he tries to make a decision on recordability based upon his professional judgment. (Tr. 220) As an example, in a situation giving rise to a claimed back complaint he would be influenced by whether there were objective findings as compared with merely subjective findings. (Tr. 258)

In each of the incidents referred to in the Citation the employee claimed an on-the-job mishap giving rise to an injury and was referred by his foreman or supervisor to Dr. Becky, a private physician who operates a "free-standing" industrial clinic. (Tr. 234, 235)

---

As to those individuals complainant alleges respondent should have reported and failed to report on its OSHA-200 for 1980, the evidence is as follows:

Milton Gaddis has been employed at General Motors Corporation approximately twenty-five years, fifteen of which he has been employed as a tractor driver in the receiving department at Denver, Colorado (Tr. 102). On January 23, 1980, he was injured while working at the plant at the receiving rail dock area. (Exhibit R-1) An accident occurred between 9:00 a.m. and 10:30 a.m. while he was unloading a box car loaded with fleet truck side panels into a flat truck. He testified he stepped backward with his left leg down between the rail car and

dock. Mr. Gaddis reported the accident and injury to his foreman, Carol Thorpe, who issued a medical pass authorizing him to see Dr. Becky. (Tr. 102-103; Exhibit R-1) Dr. Becky took x-rays and diagnosed the injury as a "strain and contusion of the pelvis and left hip." (Exhibit R-1, R-9)[2/] Mr. Gaddis testified that Dr. Becky prescribed medication and ice packs for the injured areas and sent him home. (Tr. 103, 107) Mr. Gaddis reported to Dr. Becky at 9:00 a.m. on January 24, 1980, (Exhibits R-1 and R-9) at which time he was released to return to work with no restrictions. (Tr. 108, 109; Exhibit R-1)

Dr. Prior supported the decision of Dr. Cash not to record this incident on OSHA-200 for 1980 on the basis that Mr. Gaddis returned to work on the day following the incident. In his judgment since the employee was able to return to work on the day following an incident giving rise to strain and contusion of the pelvis and hip, it was properly viewed as "first aid" and not recordable. (Tr. 252)

Robert Mack has been employed by respondent at its Denver plant for approximately fifteen years. (Tr. 198) On February 5, 1980, Mr. Mack was employed on the early shift of 6:00 a.m. to 3:00 p.m. He testified he climbed a hook ladder to pick a radiator weighing approximately twenty-seven pounds. On his way down the ladder with the part, he lost his balance and twisted his back. Mr. Mack reported the accident to his supervisor, Harold Lear, and received a pass to see Dr. Becky. (Tr. 199) Dr. Becky took x-rays and diagnosed the injury as a lumbosacral sprain and further indicated that the employee was prevented from working from February 5, 1980, through February 10, 1980. Dr. Becky

---

[2/] In a summary prepared for Dr. Cash a few days before the hearing, (Exhibit R-9) Dr. Becky indicated the "right" hip.

further indicated in his report that the disabling injury was due to his on-the-job accident. Dr. Becky released Mr. Mack to return to work on February 11, 1982. (Exhibit C-6(b))

Dr. Prior testified in support of Dr. Cash's decision not to record Mr. Mack's injury based upon the information before him at the time. (Tr. 253) However, in preparing to testify at this hearing, Dr. Prior discovered in the course of discussing the matters with Dr. Becky two days before testifying that the physician had made an objective finding of point tenderness or muscle injury of the left paraspinal muscles. (Tr. 253) Dr. Prior has now directed the local facility that Mr. Mack's injury and lost time should be recorded (presumably on OSHA-200 for 1980) based upon this newly acquired information. (Tr. 254)

Donald Pettera has worked for General Motors Corporation since April, 1969. On June 24, 1980, at approximately 11:30 a.m. Mr. Pettera was unloading some carts. This required the use of a forklift. While standing on the pallet which was resting on the forks of the Drexel tractor, he turned around and put his gloved hand on top of the mast of the forklift. As his hand was resting on top of the mast the driver started lowering the forks and Mr. Paterra's gloved hand was pulled into the chained mast which resulted in crushing his right middle finger to the first joint. (Tr. 112, 116)

Mr. Pettera's foreman, Cecil Tiggins, transported him to Dr. Becky's office for medical treatment. (Tr. 116) Dr. Becky examined the crushed finger, x-rayed the right hand and provided emergency care only and then referred Mr. Pettera to Robert J. Hoehn, M.D. The x-rays showed an

avulsed compound fracture of the terminal tuft of the middle finger. (Exhibit R-9) Mr. Peterra was told by Dr. Hoehn that the crushed finger would take about six weeks to heal. After leaving the Doctor's offices on June 24, 1980, Mr. Pettera took papers which had been furnished to him back out to General Motors plant. On one occasion while he was off work he went to the plant to see the insurance representative. While he waited in the office, Al Green spoke to him casually and asked, "When do you feel you're going to be ready to come back to work?" He was off work for 28 days, returning about August 1, 1980. During this time he received Workmen's Compensation benefits. (Tr. 118-121)

Mr. Pettera had no restrictions with respect to his left hand during that period. (Tr. 126) He was not told during this period that he could not perform light work. (Tr. 127) On about June 20, 1980, Dr. Hoehn gave him permission to use his left hand in helping with the harvest on his brother's farm in Kansas. During the six week period, the company did not reassign him to a job that had light duty. (Tr. 128) Dr. Hoehn had indicated on the form he completed that he expected Mr. Pettera to be able to return to work approximately August 1, 1980. During the time he was off work no member of management and no doctor ever told him he was entitled to light duty work. (Tr. 134)

Respondent listed the Pettera incident on its OSHA-200 for 1980, but showed 28 days of "restricted work activity". (Exhibit C-1) Complainant objects to respondent failing to declare 28 days "away from work" and to check the column indicating that the injury involved days away from work.

Homer Harris has been employed by General Motors Parts Division in Denver, Colorado for approximately seventeen years. (Tr. 189) On

September 8, 1980, Mr. Harris was working the 6:00 a.m. to 3:00 p.m. shift when he had an accident. (Tr. 190) He bumped his right elbow on one of the metal rods of the basket bin where the part was stacked. He informed his supervisor of the injury and subsequently obtained a medical pass to see Dr. Becky. (Tr. 191) X-rays were taken and Dr. Becky diagnosed the condition as contusion of the right elbow. He was treated by Dr. Becky on September 8, 9, 12 and 16, 1980, according to a report over the signature of Dr. Becky, dated September 17, 1980. In that report Dr. Becky stated that Mr. Harris was totally disabled from September 8, 1980, to and including September 14, 1980, and was able to return to work September 15, 1980. He also there stated that in his opinion the patient's disability was caused by his work and was an "on-the-job accident". (Exhibit C-4(c)) Mr. Harris was off work following his visit to Dr. Becky on September 8, 1980, until he returned to work on September 15, 1980.

In support of Dr. Cash's determination not to record the incident or time lost involving Mr. Harris, Dr. Prior stated that a large inflamed bursa of the elbow is ". . . difficult to relate to the incident the day before." In his opinion it would not develop in 24 hours. (Tr. 249, 250) He relied on Dr. Becky's letter to Dr. Cash dated February, 1982, for reference to a bursa. (Tr. 250; Ex. R-9) Any other evidence of record over the signature of Dr. Becky regarding Mr. Harris's injury describes only contusion or pain of the right elbow. (Exhibits C-4(a), C-4(b), and C-4(c))

Robert Ponikiski has been employed by General Motors at the Denver Warehouse facility since 1968 (Tr. 76) On October 16, 1980, he was lifting a thirty-five pound hub when he pulled his back. The accident occurred on a Thursday. He informed his supervisor, Harold Lear,

shortly after the accident at about 9:45 a.m. (Tr. 76-78) Mr. Ponikiski testified that after reporting the accident to Mr. Lear he returned to work the remainder of his shift on October 16, 1980, as well as his shift on October 17, 1980. He did not require medical attention until October 20, 1980, the Monday following the accident, when he requested to see Dr. Becky at 11:00 a.m. (Tr. 78)

Dr. Becky's diagnosis of Mr. Ponikiski's injury was a lumbosacral sprain which required medical treatments on October 20, 21, 22, 23, and 24, 1980. Dr. Becky also was of the opinion that Mr. Ponikiski was prevented from working from October 20, 1980, through October 26, 1980, due to this on-the-job injury. Mr. Ponikiski was released by Dr. Becky to return to full duty on Monday, October 27, 1980. (Exhibits C-8(b) and C-8(c)).

On cross-examination Mr. Ponikiski acknowledged that he had picked up hubs and other parts on and off over the course of his employment since 1968 (Tr. 98). He also testified that he had back surgery which involved removing a ruptured disc and fusing the bone back together in approximately 1969. (Tr. 98-99) Mr. Ponikiski further testified that over the course of the years, he has occasionally pulled his back. (Tr. 99) The employee also testified that his hobby is dune buggy racing. (Tr. 99)

Dr. Prior testified that in his opinion this incident was correctly determined to be non-recordable. He based his decision on the man's long-standing back problem. The late reporting caused him to question that there was an incident, and there were little or no objective findings. (Tr. 248)

Ms. Corlis Waits has worked for General Motors Corporation intermittently since 1975 and has held various job positions at the Denver facility. (Tr. 155) On Friday, October 17, 1980, Ms. Waits was working the first shift as a stocker. (Tr. 155-156). At about 9:30 a.m. she climbed a ladder with a box of parts and strained or pulled a muscle in her back. (Tr. 156-157) At that time she reported the incident and injury to her foreman, Ken Ray. (Tr. 157; 163) She was not clear on when she saw Dr. Becky for this condition. (Tr. 157) Dr. Becky's report indicates she was examined and treated for the first time on October 20, 1980. Dr. Becky saw Ms. Waits on October 20, 22, 23, 24, and 26, 1980, and diagnosed the injury as a dorsal and cervical sprain and sprain of the right foot. The medical and diagnostic procedures performed on Ms. Waits included an x-ray of the cervical spine and dorsal spine and right foot and ultrasonic therapy. Dr. Becky further indicated that Ms. Waits' disability was due to work-related accident. He reported her to be totally disabled and prevented from working from October 20th through October 26th. She was released to return to work on October 27, 1980, by Dr. Becky. (Exhibits C-5(c) and R-9)

Whereas Ms. Waits testified that she felt pain in her back and neck while lifting parts on October 17, 1980, Dr. Becky's report, Exhibit C-5(c) indicates he treated her for cervical and dorsal sprain and sprain of the right foot reportedly stemming from lifting parts on October 16, 1980. (Tr. 156, 157; Exhibits C-5(c) and R-9) Ms. Waits testified that she saw Dr. Becky on Monday, October 20, and returned to work that day and that she also worked October 21. On Wednesday,

October 22, Dr. Becky restricted her to light duty. However she was sent home because her foreman told her there was no light duty work for her to perform. (Tr. 158) She thought Dr. Becky was supposed to have taken her off work on Monday when she first reported to him, but the forms he sent back with her didn't specify that. (Tr. 159) The record doesn't disclose when she returned to work, but she received Workmen's Compensation for approximately three days and was ". . . on the clock for a couple . . ." of days. (Tr. 160) Dr. Becky's report indicates she was totally disabled and prevented from working from October 20 to October 26, inclusive. (Exhibit C-5(c))

On cross-examination Ms. Waits was asked if all she reported to her foreman was back strain and she answered, "Maybe my foot hurt." (Tr. 164) She also stated that the incident of injuring herself occurred in the morning of October 17 and that she reported it to her foreman immediately. (Tr. 166) Pink slips produced by the respondent indicate that Ms. Waits left work on October 17 at 10:30 a.m. and that she returned to work on Monday, October 20, 1980, at 10:19 a.m. The reason given was "ill and Court". (Exhibit R-3) Also Ms. Waits gave as the reason for her absence on Tuesday, October 21, 1980, according to pink slip produced by the respondent "Dentist". (Exhibit R-4) According to the pink slip given for absence from 3:30 p.m. October 22, 1980, through October 27, 1980, Ms. Waits gave as the reason for said absence "Sprang (sic) foot" (Exhibit R-5)

Dr. Prior, in support of Dr. Cash's decision not to record Ms. Waits' incident on OSHA-200 for 1980, was impressed with the discrepancy

as to the time of the incident; the diagnosis where at the plant it was a back injury and at the doctor's office it was a back and foot; and his review disclosed no objective findings. Under the circumstances, Dr. Prior considered this to be at most a first aid and therefore not recordable. (Tr. 244, 246)

George Marshall has been employed by respondent for seventeen years. On October 23, 1980, Mr. Marshall was working the first shift, 6:30 a.m. to 3:00 p.m. (Tr. 136, 137) At about 8:30 a.m. he was handling an automobile hood part, weighing approximately seventy to eighty pounds (Tr. 146) with a fellow worker when he pulled his back. (Tr. 138) Mr. Marshall was given a medical pass to see Dr. Becky. Dr. Becky informed Mr. Marshall, after completing a urinalysis, that Mr. Marshall had a kidney infection, and prescribed triacycline. Dr. Becky also took x-rays of the back and diagnosed "dorsal and lumbosacral sprain". Mr. Marshall was seen at the office of Dr. Becky on October 23, 24, 27, and 31, 1980, and was treated with ultrasound. Dr. Becky determined Mr. Marshall to be totally disabled and prevented from working from October 23, 1980, to and including October 27, 1980, and gave his opinion that said disability was caused by a work related accident. (Exhibits C-7(a) and R-9) Assuming respondent's work force did not work on Fridays and Saturdays, Mr. Marshall would have thus missed three workdays including the day of the incident. (Tr. 140, 141)

Dr. Prior testified that he agreed with Dr. Cash that this incident was not recordable. In effect he renounced the diagnosis of Dr. Becky and was of the opinion that the kidney infection fully explained Mr. Marshall's back complaint. (Tr. 256-258)

## Discussion

Respondent urges that professional medical judgment is required to make a determination of recordability. Not one case is advanced by respondent in support of this novel proposition, which is here rejected. Here each of the employees claiming a job connected injury was sent to an independent medical practitioner of respondent's choosing. In each instance that' practitioner of industrial medicine made a diagnosis of work related injury giving rise to disability rendering the employee unable to work for a designated period of time. Each employee was seen by the physician on more than one occasion as a result of the incident, and all were subjected to x-rays. All missed work days as a result of their work related incident.

In the face of such medically supported data it ill behooves the respondent to follow a policy of allowing its Division Medical Directors to second-guess and even ignore the findings of the treating physician. That which must be recorded on OSHA-200 is determined by the standard at 29 C.F.R. 1904.2(a), the definitions of "Recordable occupational injuries or illnesses" found at 29 C.F.R. 1904.12 and the form and instructions on form OSHA No. 200 (Exhibit C-9)

Milton Gaddis: Dr. Prior testified this incident was nothing more than first aid and therefore not recordable. "First Aid" is defined at 29 C.F.R. 1926.12(e). Here x-rays were taken, medicine prescribed, and strain and contusion of the left hip was diagnosed. This is more than "First aid" as defined. Furthermore, Mr. Gaddis was not released to return to work until after his 9:00 a.m. appointment with Dr. Becky on the day following the incident. The incident is therefore recordable under the instruction found at columns 2 and 9 of OSHA No. 200 and the standard at 29 C.F.R. 1904.12(f).

Robert Mack: Notwithstanding Dr. Becky's notation on Exhibit C-6(b), dated February 12, 1980, that there were objective findings of lumbosacral strain, Dr. Cash elected not to record this incident on OSHA-200 for 1980. In Dr. Becky's summary report to Dr. Cash dated February 1, 1982, a history of degenerative disease was noted, including back surgery ten years earlier. Dr. Becky there indicates that following medication and rest Mr. Mack "was OK'd for full duty . . ." six days after the incident. (Exhibit R-9) Dr. Prior allowed that this incident was properly recordable. He based this on his conversation with Dr. Becky 1 or 2 days before testifying, wherein Dr. Becky reported that there were certain objective findings. There is no reason to believe that Dr. Cash could not have availed himself of the same detail before electing not to record the incident. The objective finding was ever present. It was not "new evidence" as suggested by Dr. Prior. (Tr. 275, 279)

Donald Pettera: This employee was away from work for 28 days as the result of a work related accident. Although the incident was reported on OSHA-200 for 1980, the 28 days were listed under column 5 as days of restricted work activity. Respondent attempts to justify this mis-reporting on the grounds that since only the right middle finger was crushed, the employee still had a good left hand and two healthy feet, and indeed assisted his brother at harvest time.

The fact remains that Mr. Pettera did not work for respondent for 28 workdays. He received Workmen's Compensation for that period. No evidence was presented that Mr. Pettera was ever offered light duty work by the respondent or that he engaged in any restricted work activity whatsoever. The incident should properly have been recorded to show 28 days away from work.

Homer Harris: In justifying Dr. Cash's determination that this incident was unrecordable, Dr. Prior opined that a large inflamed bursa would not ordinarily develop within 24 hours of a triggering incident. However, there was no evidence that Dr. Cash was so influenced at the time he made his determination. Reference to a bursa first appears in Dr. Becky's summary report of February 1, 1982. The fact remains that the treating physician found and reported to respondent all of the essentials of a work related incident, causing seven lost work days. Dr. Cash had no basis for not recording the incident. Dr. Prior's opinion is a self-serving position based upon semantics taken in opposition to a clear record made by the treating physician. The incident should properly have been recorded.

Robert Ponikiski: The decision not to record Mr. Ponikiski's reported and treated injury was totally unjustified. Dr. Prior supported this decision on the basis of the employee's long standing back problem, the delay between the claimed incident and seeing the doctor, and the lack of objective findings. It is apparent to any informed person that a history of back problems would indicate such a person would be predisposed to back injury or complaint arising from relatively minor triggering mechanisms.

It is also easy to understand that such a person upon detecting a back response to a lifting incident would quickly report the incident in order to protect himself should the injury prove to develop into something serious.

On cross-examination respondent brought out from this employee that his hobby was dune buggy racing. However, no evidence was produced to suggest that this employee was engaged in dune buggy racing on October 18 or October 19 before seeing Dr. Becky on October 20, 1980. The evidence is that Mr. Ponikiski felt a pull in his back while lifting

a thirty-five pound auto part on October 16, 1980. He informed his supervisor shortly thereafter at about 9:45 a.m. on that day. He worked the remainder of that day and Friday, October 17. On Monday, October 20, 1980, he saw Dr. Becky whose report compels viewing this as a recordable incident involving lost work days.

Dr. Cash's determination not to record the incident is without foundation and Dr. Prior's attempt to support Dr. Cash's failure to report the incident is without merit.

Corlis Waits: In support of Dr. Cash's decision not to record this incident Dr. Prior opined that at most this was a "first aid." Once again, however, this does not fall within the definition of "first aid" set forth in the standard and the OSHA No. 200. Ms. Waits received x-rays and ultrasonic therapy. As evaluated by the treating physician who saw this employee on six visits in a seven day period, she sustained disability which rendered her incapable of working as a result of work related accident. Admittedly, Ms. Waits testified only that she pulled her back and "maybe my foot hurt." Her absence pink slip for October 22, 1980, through October 27, 1980, gives as reason for absence "Sprang (sic) foot." Nevertheless both conditions were found to exist by Dr. Becky and diagnosed as arising from the incident of October 17, 1980. Dr. Becky was engaged by respondent and reported to it. There is a failure of evidence to justify the decision of Dr. Cash to ignore Dr. Becky's report which on its face required recording of the incident.

George Marshall: In support of Dr. Cash's decision not to record this incident, Dr. Prior expressed his opinion that Mr. Marshall's complaints were consistent with kidney infection and that a "negative urinalysis" was the only objective finding. (Tr. 258)

It was not explained at the hearing on what basis Dr. Cash determined this incident to be unrecordable. The only references to kidney infection came from Mr. Marshall in his testimony. In his summary report to Dr. Cash dated February 1, 1982, Dr. Becky first mentioned in passing that Mr. Marshall ". . . also had a history of GU problems." (Exhibit R-9) There is no evidence of record that Dr. Cash was aware of a kidney infection coinciding with Mr. Marshall's back complaints at the time he elected not to record the work related incident complained of by Mr. Marshall.

There is no reason why Mr. Marshall could not have experienced both a kidney infection and a back sprain resulting from a work related incident at one and the same time. Dr. Becky, who observed and treated Mr. Marshall, so found. The incident was clearly recordable and illustrates a push on the part of respondent to under-record work related injuries.

---

Respondent argues in its brief on appeal that the amendment to the Citation set forth in the complaint and permitted at the hearing should be stricken as improper. This argument is rejected. It is true that complainant gave only a minimal explanation in the complaint as to his reason for seeking the amendment.

Here the amendment sought to change the Citation from alleging an other than serious violation to a willful violation and increase the penalty from $100.00 to $1,000.00.

The Commission has ruled that where an amended charge set forth in the complaint arose out of the same occurence as the original charge set forth in the Citation, it will be permitted absent prejudice to the

non-moving party. P.A.F. Equipment Co., 79 OSAHRC 18/A2, 7 BNA OSHC 1209, 1979 CCH OSHD ¶23,421, and cases there cited, affirmed 637 F. 2d 741 (10th Circuit 1980). Respondent has not demonstrated prejudice here. The complaint was filed herein and served upon the respondent more than three months prior to the hearing and respondent had ample time to prepare its defense against the charge of willful.

---

Instructions set forth on each OSHA No. 200 are clear as to what entries must be made on the form. Respondent is well aware of the record-keeping requirements of 29 C.F.R. 1904 since it had access to and utilized the OSHA publication, "What Every Employer Needs to Know about OSHA Recordkeeping." (Exhibit J-1, Tr. 269-271) Respondent heretofore litigated the issue of recordability having to do with its determination not to record work related illnesses on OSHA No. 200 in the face of medical evidence to the contrary. The Commission there ruled against the respondent and advised that the legislative history of the Act ". . . shows a clear Congressional intent that this reporting requirement be interpreted broadly in order to develop information for future use." Secretary v. General Motors Corp. (Inland Division) 1980 CCH OSHD ¶24,743, p. 30,469, again at page 30,470, the Commission stated:

> Respondent has argued that it was only responsible to record illnesses which it found were directly caused by the occupational environment. We reject this narrow interpretation of the recording obligation. . . . Under this interpretation of the statute and regulations, OSHA and NIOSH would be significantly restrained from fulfilling their statutory obligation of making the workplace healthier.

Respondent reacted affirmatively to an objection raised by the representative of affected employees to the sufficiency of the OSHA-200 for 1978. However, when that representative objected to the sufficiency of

recording on its OSHA-200 for 1980, respondent manifested a determination to remain married to the recording concepts from which the Commission had advised it to divorce itself in the Inland Division case, supra.

By persisting in this view of its recording obligation, respondent tends to frustrate the purpose of the Act and recording regulations as stated at 29 C.F.R. 1904.1.

Respondent's decisions not to record those work related incidents giving rise to injuries and lost workdays properly found herein to be recordable were conscious, deliberate, intentional and voluntary and fall within the definition of "willful" recited by the Commission in Tri-City Construction Company, 1980 CCH OSHD ¶24,557 at page 29,433:

> . . . that regardless of venial motive, willfulness is established by a conscious, intentional, deliberate decision and may be characterized by a careless disregard of the requirements of the Act . . . (quoting from Titanium Metals Corporation of America, 1980 OSHD ¶24,199)

See also Kent Nowlin Construction Company v. OSHRC, 593 F. 2d 368, 372, where the Tenth Circuit Court held:

> The failure to comply with a safety standard under the Occupational Safety and Health Act is willful if done knowingly and purposely by an employer who, having a free will or choice, either intentionally disregards the standard or is plainly indifferent to its requirement. An omission or failure to act is willfully done if done voluntarily and intentionally.

Respondent's violation of the recording standard complained of here was willful and the amended proposed penalty in the sum of $1,000.00 is appropriate considering the factors set forth in Section 17(j) of the Act.

---

Having considered the Citation, the Notice of Contest, the Complaint and Answer, and having considered the Exhibits received in evidence, the testimony of the witnesses and having observed their demeanor and weighed the credibility thereof, and having considered the post-hearing memoranda of the parties, there are hereby entered the following:

## Findings of Fact

1. Respondent is a corporation with a place of business located at 4355 Kearney Street, Denver, Colorado, where it engages in the operation of warehousing and distributing auto parts.

2. Respondent employs a number of people at said place of business and uses materials or equipment which have crossed state lines.

3. Respondent is engaged in a business affecting commerce and is an employer within the meaning of the Act.

4. The respondent's Denver facility does not have an in-house medical staff. Employees with medical complaints or problems are referred by respondent to Dr. Becky, a private practitioner of industrial medicine who operates an independent clinic and accepts referrals from other industries and businesses in addition to respondent.

5. The OSHA-200 form is completed at respondent's facility under the direction of respondent's Divisional Medical Director, Dr. Cash, whose office is in Flint, Michigan.

6. An employee at the Denver facility contacts Dr. Cash by telephone and relays all available information concerning alleged accidents and injuries reported by the employees in the warehouse, and Dr. Cash determines whether the incident is recordable.

7. Dr. Cash, in making his determination, refers to OSHA guidelines.

8. As to each of the incidents listed on the Citation, Dr. Cash, without personally examining the employee determined the incident to be non-recordable or in the instance of Don Pettera that it was recordable as restricted work.

9. The information upon which Dr. Prior determined that the incident involving Robert Mack was properly recordable was not new information and could have been available to Dr. Cash had he made reasonable inquiry prior to making the determination not to record said incident.

10. Those findings of fact expressed elsewhere in this decision as though again set forth at this point.

11. The incident involving Milton Gaddis involved lost work and medical treatment beyond first aid and was recordable.

12. The incident involving Robert Mack was recordable and respondent's acknowledgement of that fact at the hearing was not the result of new evidence, but only respondent's belatedly availing itself of evidence which was always available to it upon making reasonable inquiry.

13. Robert Pettera was never offered or required to perform restricted work. Robert Pettera never engaged in restricted work activity but in fact missed 28 workdays as a result of work related injury. Said 28 days should properly have been recorded as days away from work.

14. The incident concerning Homer Harris involved lost work and medical treatment to a job related injury giving rise to a contusion of the right elbow and should properly have been recorded.

15. The incident regarding Robert Ponikiski involved lost workdays and medical treatment and should properly have been recorded.

16. The incident concerning Corlis Waits involved lost workdays and medical treatment beyond first aid and should properly have been recorded.

17. The incident involving George Marshall caused back injury requiring medical treatment and resulted in lost workdays. The incident should have been recorded.

18. Respondent experienced no prejudice as a result of the amendment to the Citation changing the characterization of the violation from other than serious to willful and increasing the proposed penalty.

19. Respondent exercised conscious intentional and deliberate conduct in arriving at its voluntary and repeated decisions not to record the job related incidents complained of.

20. Respondent's conduct manifested a push to under-recording of job related injuries pursued on an organization and policy basis.

21. When under-recording was called to its attention, respondent continued to disregard the requirements of the Act concerning recording.

22. An appropriate penalty is the sum of $1,000.00.

## Conclusions of Law

1. The Commission has jurisdiction of the parties and of the subject matter of these proceedings.

2. The amendment of the Citation to allege a willful rather than other than serious violation of the Act and to propose a penalty of $1,000.00 rather than $100.00 as allowed at the hearing will stand.

3. Respondent was in violation of the standard at 29 C.F.R. §1904.2(a) as alleged in the Citation.

4. Respondent's violation of the standard was willful.

5. Item 1 of Citation No. 1, issued to the respondent September 23, 1981, should be affirmed as a willful violation of the Act and a penalty of $1,000.00 should be assessed.

ORDER

Item 1 of Citation No. 1, issued to respondent September 23, 1981, is AFFIRMED as a WILLFUL violation of the standard at 29 C.F.R. §1904.2(a) and a penalty of $1,000.00 is ASSESSED.

NOTICE OF DECISION

Secretary of Labor v. FANTONI COMPANY, INC.
OSHRC Docket No. 81-2651

1. Enclosed is a copy of my decision. It will be filed with the Commission on June 14, 1982, and will become the final order of the Commission on July 14, 1982, unless a Member of the Commission directs that it be reviewed.

2. You may petition for discretionary review of this decision by the Commission. A petition may be filed directly with me within twenty (20) days from the mailing of my decision. Thereafter, a petition should be mailed to the Executive Secretary, Attention:

   Chief Review Counsel
   Occupational Safety and Health Review Commission
   1825 K Street, N.W., Suite 601
   Washington, D.C. 20006.

   Any petition filed directly with the Commission will be considered to the extent that time and resources permit. The last day the Commission may consider your petition is June 14, 1982. This final order date is fixed by law and cannot be extended under any circumstances.

3. If review is ordered by a Member of the Commission, each party to this case will be notified. In addition, each party will be given an opportunity to submit a brief to the Commission.

4. Please complete the enclosed postcard indicating whether you presently intend to seek review of this decision and mail the completed card promptly. Your response does not bind you in any way, but it assists the Commission in processing your petition when it is filed.

5. For any further details on the review process, see Commission Rules 90, 91, 92, and 93.

OCCUPATIONAL SAFETY AND HEALTH REVIEW COMMISSION

| | |
|---|---|
| SECRETARY OF LABOR,<br>Complainant<br>v.<br>FANTONI COMPANY, INC.,<br>Respondent | OSHRC DOCKET NO. 81-2651 |

APPEARANCES:

Robert J. Murphy, Esq., for Complainant

Leo S. McNamara, Esq., for Respondent

DECISION AND ORDER

This case arose under 29 USC, sec. 651 et seq. of the Occupational Safety and Health Act of 1970 (the Act). As a result of an inspection by the Occupational Safety and Health Administration [OSHA] of the Respondent's premises on August 27 to November 2, 1981, Citation #1 was issued on or about November 13, 1981, charging that the Respondent violated sec. 5(a)(2) of the Act by the serious violation of the standard at 29 CFR 1926.651(c).

On November 27, 1981, the Respondent filed Notice of Contest to the Citation and the penalty proposed therefor.

The pertinent sections of the Act and the standard are appended to this decision under appropriate titles.

## BACKGROUND

The jobsite, an excavation about 60 feet long, 40 feet wide, and 10 - 15 feet deep (herein called the accident excavation) was adjacent to or connected by a passageway with another unshored excavation (herein called the first excavation) some 150 feet long by 120 feet wide and 28 to 32 feet deep. Both excavations were composed of substantially the same material: peat for several feet of depth and then clay or sandy silt.

The first excavation had been dug in March, 1981, and the second one was begun in August, 1981. On August 26, 1981, the Respondent's employee, Cordeiro, was killed when the eastern wall of the second excavation collapsed, burying him. He had been working in that eacavation for about 30 minutes that day...Tr. 104, 108.

## ISSUES

Since the Respondent stipulated that there was no shoring system (Tr. 92), the only issues are:

1. Was there a danger from moving ground?

2. Were the walls of the accident excavation adequately guarded by sloping or some other equivalent means?

3. Did the Respondent have knowledge of any hazardous condition of the accident excavation?

## EVIDENCE

Webster, who worked for the Nahant Water Department, testified that the jobsite was in a "marshland" and the walls of the accident excavation were "vertical"...Tr. 25, 26, 39, 50.

Waters, a policeman, testified that the jobsite was "marshy", the walls of the accident excavation were "vertical", and they were not shored or sloped or supported...Tr. 72, 78, 79, 91, 92.

Murphy, the Respondent's backhoe operator, testified that the wall that collapsed was "slightly sloped", "not 2 to 1", and the accident excavation was "sloppy"...Tr. 108, 142.

La Marre, an inspector for the Department of Labor of the Commonwealth of Massachusetts, testified that the immediately adjacent first excavation was unshored but safe...Tr. 150 - 152.

Yanovitch, the Compliance Officer, testified that the day after the accident, he took a soil sample from the eastern wall of the accident excavation that was representative of the soil in that area. He said the soil was "very, very soft" and had "no stability at all" and was "very unstable...like a garden material"...Tr. 195 - 203, Exh. C-45.

Hoxie, the well-qualified expert, testified that the sample (Exh. C-45) was peaty soil with "no strength, no stability, no structure"; and that, in the conditions here, "moving ground is expected"...Tr. 292, 323, 326.

Carvalho, the Respondent's backhoe operator, testified that the walls of the accident excavation were "all peat" without any clay, sand, or silt...Tr. 361, 362.

Miguel, the Respondent's foreman, testified that the accident excavation was being sloped but "not two to one"; and that the material removed from it was "peat...roots and stuff like that"...Tr. 383 - 389.

Leonard, the Respondent's project engineer, testified that the first excavation, which was next to the excavation where the accident occurred, had had no movement of peat or failure of its peat walls although it had been maintained from March through December, 1981, without shoring; and, during that time, heavy vehicles and earth equipment were pounding the ground so hard that the earth could be seen moving and felt shaking...Tr. 416, 428 - 430.

## DISCUSSION

I find that the walls of the excavation were virtually "vertical". I base that finding on the testimony of two disinterested witnesses [Webster and Waters] to that effect while the strongest evidence that the Respondent could present to the contrary was testimony of its own employees [Murphy, Carvalho, and Miguel] tending to establish that the walls were "slightly sloped" and "not two to one".

I find that the wall that collapsed was composed mostly of peat. The testimony of the expert, Hoxie, to that effect was corroborated by the Respondent's employees Carvalho and Miguel.

I find that the material in the wall that collapsed was unstable. The testimony of the experienced Compliance Officer (Yanovitch) and the well-qualified expert (Hoxie) to that effect was not contradicted by any witness. Moreover, it was corroborated by the soil sample itself (Exh. C-45). The very happening of the accident is additional corroboration, although I make no finding based on that alone or as corroboration.

The Respondent's employee was exposed to the danger of the collapse of a wall of the excavation. He was in the excavation for at least half an hour before buried by the wall's collapse. Supervisory personnel of the Respondent

knew he was working in the excavation.

## DEFENSE

The Respondent contended that the adjoining excavation was deeper, had more vertical walls, and had been subjected to the pounding of heavy equipment for several months. Its main defense seemed to be that, if the walls of the adjoining excavation had not collapsed under such conditions, the jobsite in question was certainly safer or, at the very least, the Respondent obviously had no knowledge of the possible hazard.

That defense does not prevail. The mere fact that no accident occurred in the adjoining excavation does not mean the jobsite in question was not hazardous. As concerns the pounding by heavy equipment, that factor could tend to establish a hazard as consistently as it might be interpreted to negate one. The Respondent would not be justified in assuming that the excavation in question was safe merely because the adjoining excavation had not collapsed. Its supervisory employees knew, or should have known, that the walls of the excavation where the accident occurred were composed of unstable material that was likely to move if not shored or adequately sloped or otherwise guarded.

## FINDINGS OF FACT

Having heard the testimony, observed the witnesses, and examined the exhibits, the following Findings of Fact are made:

1. At all times concerned, the Respondent regularly received, handled or worked with goods which had moved across state lines.

2. As concerns Citation #1, an exployee was explosed to danger from moving ground in an excavation wall that was not guarded by a shoring system, sloping of the ground, or other equivalent means.

3. The conditions described in Citation #1 exposed the Respondent's employees to sustaining serious or fatal harm because of the hazard of collapse of the wall.

4. One or more officers or supervisory personnel of the Respondent knew of the hazardous conditions described herein and knew that employees were exposed to such hazard.

## CONCLUSIONS OF LAW

1. At all times concerned, the Respondent was an employer engaged in a business affecting commerce within the meaning of the Act; and the Occupational Safety & Health Review Commission has jurisdiction over the subject matter and the parties.

2. At all times concerned, the Respondent knew, or with the exercise of due diligence should have known, of the alleged violation.

3. On the date in question, the Respondent was not in compliance with the standard at 29 CFR 1926.651(c) and the Complainant has sustained the burden of proving the Respondent violated sec. 5(a)(2) of the Act (sec. 654).

## BRIEFS AND PROPOSED FINDINGS

I have considered the parties' briefs and proposed findings and conclusions. To the extent shown above, they are adopted; otherwise, they are rejected as not being supported by the evidence or law.

## ORDER

The whole record having been considered, and due consideration having been given to 29 U.S.C., sec. 666(j) and the fact that the adjoining

excavation's walls had not collapsed, it is ordered:

1. Citation #1 is affirmed, and a penalty of $50 assessed therefor.

SO ORDERED.

## APPENDIX

### THE ACT

Section 654 [section 5(a)(2)] Employer "...shall comply with occupational safety and health standards..."

Section 666 [section 17(b)] "...employer who has received a citation for a serious violation...of this Act...shall be assessed a civil penalty of up to $1,000 for each such violation."

Section 666 [section 17(j)] "...assess all civil penalties...giving due consideration to...the size of the business...gravity of the violation, the good faith of the employer, and the history of previous violations."

Section 666 [section 17(k)] "...a serious violation shall be deemed to exist...if there is a substantial probability that death or serious physical harm could result...unless the employer did not, and could not...know of the presence of the violation."

### THE STANDARD

1926.651(c): "The walls and faces of all excavations in which employees are exposed to danger from moving ground shall be guarded by a shoring system, sloping of the ground, or some other equivalent means."

OCCUPATIONAL SAFETY AND HEALTH REVIEW COMMISSION

| | |
|---|---|
| SECRETARY OF LABOR,<br><br>Complainant,<br><br>v.<br><br>SYNTRON, INC.,<br><br>Respondent. | OSHRC Docket No. 81-1491-S |

**ORDER OF REMAND**

Before: ROWLAND, Chairman; CLEARY and COTTINE, Commissioners.

BY THE COMMISSION:

The Secretary of Labor issued to Syntron, Inc. two citations alleging a violation of the machine guarding standard at 29 C.F.R. § 1910.212(a)(1) and violations of sections 1903.2(a)(1)(OSHA poster) and 1904.2(a)(injury log). Judge LaVecchia's decision vacated the first citation because "an alleged photograph of the saw . . . was shown to be a saw other than the one operated by [Syntron], and was apparently photographed in a different machine shop. This constitutes a fatal flaw in the government's case." The judge alternatively held that "evidence submitted by [Syntron] with respect to its saw operation indicated that the operator normally has his body or extremities at least one foot away from the point of operation." The judge vacated the other citation because it was not addressed at the hearing. The Secretary has advanced several arguments that the judge's decision was wrong. We decline to resolve the Secretary's arguments at this time.

An administrative law judge's decision must include findings of fact, conclusions of law and a statement of the reasons or bases for the decision. 1/

---

1/ See 29 U.S.C. § 659(c), section 10(c) of the Occupational Safety and Health Act of 1970, 29 U.S.C. §§ 651-678 ("the Act"); 5 U.S.C. § 557(c), section

(cont'd)

The judge's decision does not explain why the introduction of an inapposite exhibit constitutes a "fatal flaw" in the Secretary's case or why the fact that the operator normally stands a foot away from the point of operation is dispositive. The decision also lacks specific findings on whether, under section 1910.212(a)(1), there was a point of operation hazard and whether a method of machine guarding was not provided to protect the operator and other employees in the machine area. We therefore remand this aspect of the case for the filing of a new decision. 2/

We also remand for further consideration of the posting and injury log citation. The Secretary has argued to the Commission that the notice of contest did not put these matters in issue. The judge should consider whether the second citation was contested.

Accordingly, the judge's decision is vacated and the case is remanded for further proceedings consistent with this opinion.

SO ORDERED.

FOR THE COMMISSION

Ray H. Darling, Jr.

Ray H. Darling, Jr.
Executive Secretary

DATED: JUL 19 1982

---

(Footnote 1 cont'd)
